

# LOW-COST LORA GATEWAY: A STEP-BY-STEP TUTORIAL

PROF. CONGDUC PHAM  
[HTTP://WWW.UNIV-PAU.FR/~CPHAM](http://www.univ-pau.fr/~cpham)  
UNIVERSITÉ DE PAU, FRANCE

# CONTENTS

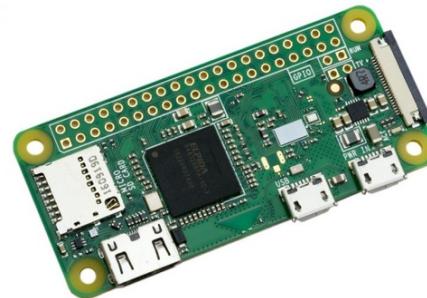

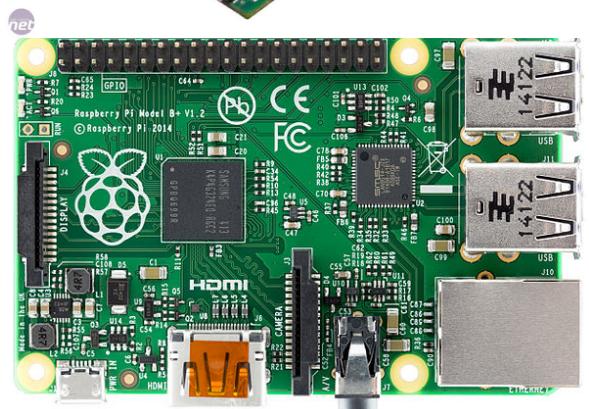

---

- We will show how to build a low-cost LoRa gateway to collect data from end-devices
- Configuration and update procedures will also be shown
- The device part will be shown in a separate tutorial
- The hardware platform is a Raspberry Pi. RPI 1B/B+, 2B and 3B have been successfully tested
- But it is also necessary to read information from
  - <https://github.com/CongducPham/LowCostLoRaGw>
  - [https://github.com/CongducPham/LowCostLoRaGw/tree/master/gw\\_full\\_latest](https://github.com/CongducPham/LowCostLoRaGw/tree/master/gw_full_latest)
- As there are many issues that are not described here
- Let's get started...

# ASSEMBLING THE HARDWARE

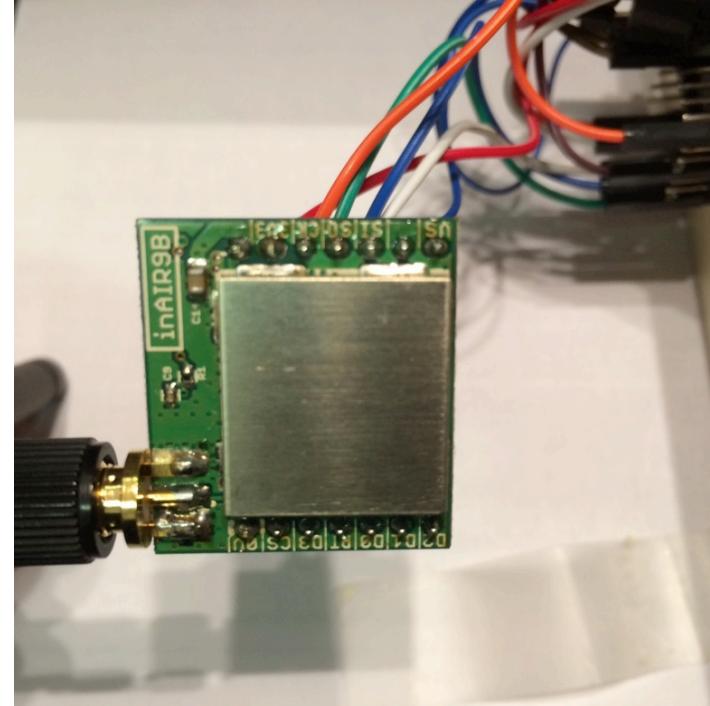

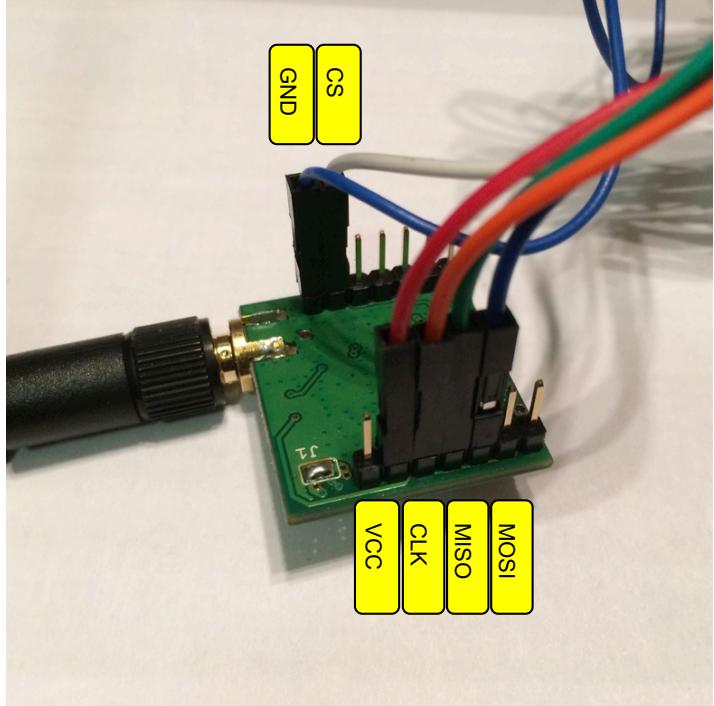

# GET THE RASPBERRY

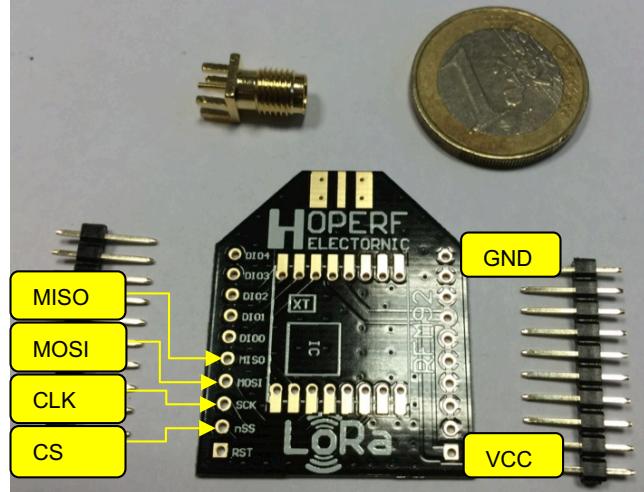

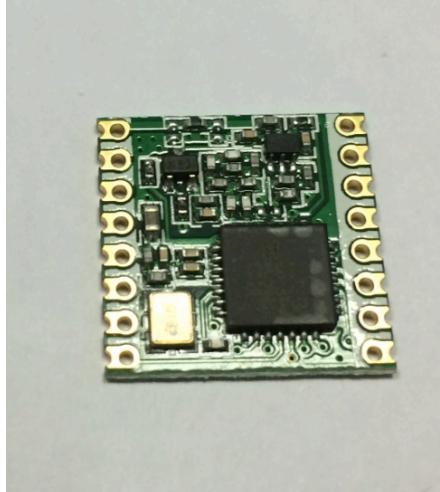

You can use RaspberryPI 1 model B or B+, RaspberryPI 2 model B, RaspberryPI 3 model B and RaspberryPI Zero (W). The most important usefull feature is the Ethernet interface for easy Internet connection. You can add WiFi with a WiFi USB dongle to use access-point features. With the RPI3 & RPI0W, WiFi and Bluetooth are embedded on the board.

# NOW THE RADIO MODULE (1)

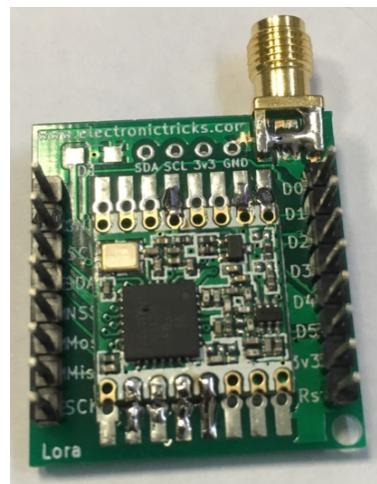

If you go for the inAir (9,9B,4) from Modtronix, the header pins can come fully assembled. Take the 6mm header pins to have enough length to connect F/F breadboard cables (left). Connect the SPI pins with the F/F cables. Try to use different colors. I use the following colors: MOSI (blue), MISO (green), CS (white), CLK (orange). Then connect also the VCC (red) and the GND (black or any other dark color) of the radio board.

# NOW THE RADIO MODULE (2)

If you take the HopeRF RFM 92W/95W you may need the adaptor breakout and to go through some delicate but simple soldering tasks! It is not difficult but you have to trained a bit before! Then, like for the inAir9, use F/F breadboard cable to connect the SPI pins, using different colors as explained previously.

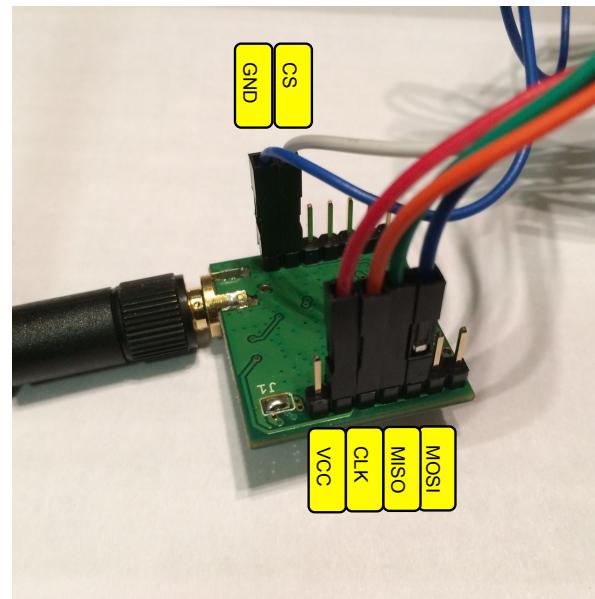

Another breakout from  
[https://github.com/ccadic/RFM95LORA\\_Breadboard](https://github.com/ccadic/RFM95LORA_Breadboard)

Another breakout from Tindie  
[https://www.tindie.com/products/leon\\_ahi/rfm95-lora-breakout-board/](https://www.tindie.com/products/leon_ahi/rfm95-lora-breakout-board/)

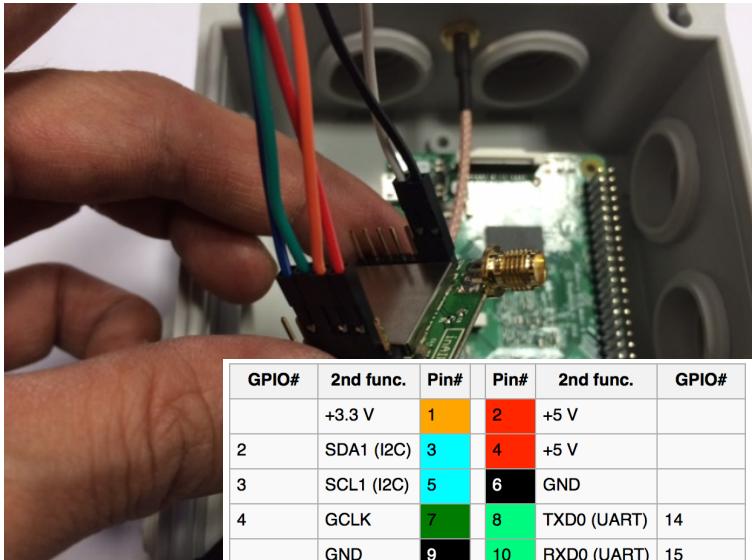

# CONNECTING THE RADIO MODULE (1)

GPIO#	2nd func.	Pin#	Pin#	2nd func.	GPIO#
	+3.3 V	1	2	+5 V	
2	SDA1 (I2C)	3	4	+5 V	
3	SCL1 (I2C)	5	6	GND	
4	GCLK	7	8	TXD0 (UART)	14
	GND	9	10	RXD0 (UART)	15
17	GEN0	11	12	GEN1	18
27	GEN2	13	14	GND	
22	GEN3	15	16	GEN4	23
	+3.3 V	17	18	GEN5	24
10	MOSI (SPI)	19	20	GND	
9	MISO (SPI)	21	22	GEN6	25
11	SCLK (SPI)	23	24	CE0_N (SPI)	8
	GND	25	26	CE1_N (SPI)	7
(RPI 1 Models A and B stop here)					
EEPROM	ID_SD	27	28	ID_SC	EEPROM
5	N/A	29	30	GND	
6	N/A	31	32		12
13	N/A	33	34	GND	
19	N/A	35	36	N/A	16
26	N/A	37	38	Digital IN	20
	GND	39	40	Digital OUT	21

Depending on the model, you can have the « short » or the « long » GPIO interface. However, the SPI pins are at the same location therefore it does not change the way you connect the radio module if you take pin 1 as the reference. Connect the SPI pins (MOSI, MISO, CLK, CS) of the radio to the corresponding pins on the RPI. Note that CS goes to CE0\_N on the RPI.

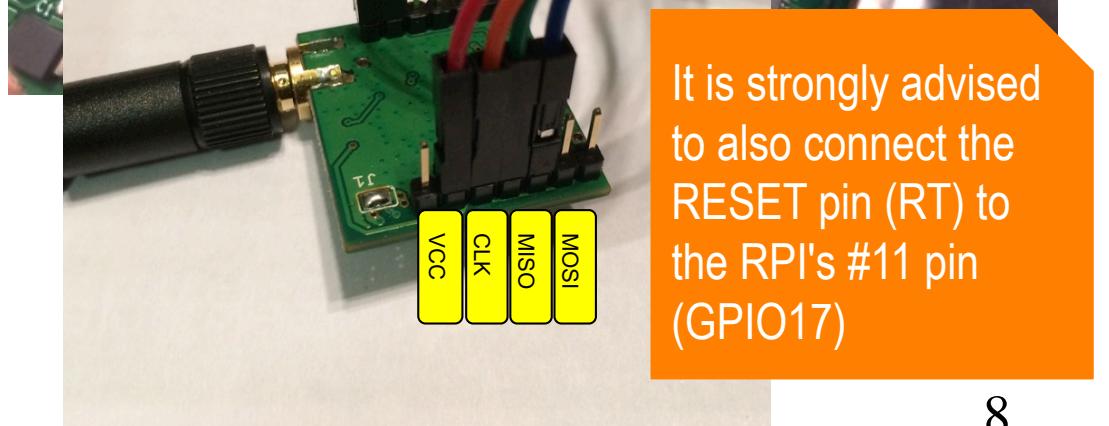

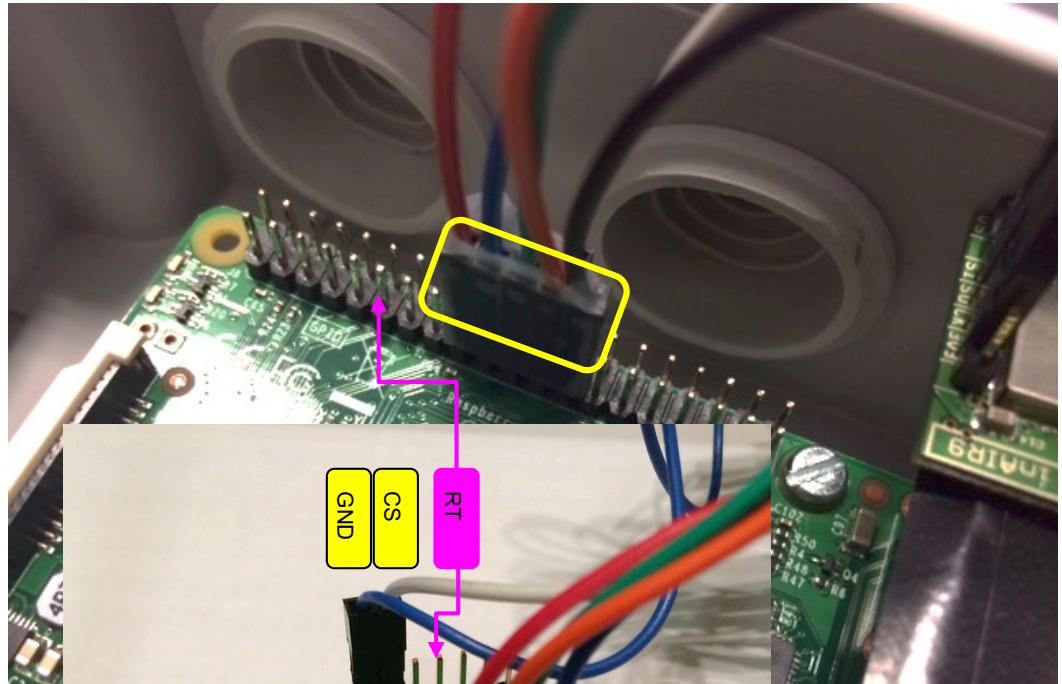

# CONNECTING THE RADIO MODULE (2)

GPIO#	2nd func.	Pin#	Pin#	2nd func.	GPIO#
	+3.3 V	1	2	+5 V	
2	SDA1 (I2C)	3	4	+5 V	
3	SCL1 (I2C)	5	6	GND	
4	GCLK	7	8	TXDO (UART)	14
	GND	9	10	RXD0 (UART)	15
17	GEN0	11	12	GEN1	18
27	GEN2	13	14	GND	
22	GEN3	15	16	GEN4	23
	+3.3 V	17	18	GEN5	24
10	MOSI (SPI)	19	20	GND	
9	MISO (SPI)	21	22	GEN6	25
11	SCLK (SPI)	23	24	CE0_N (SPI)	8
	GND	25	26	CE1_N (SPI)	7

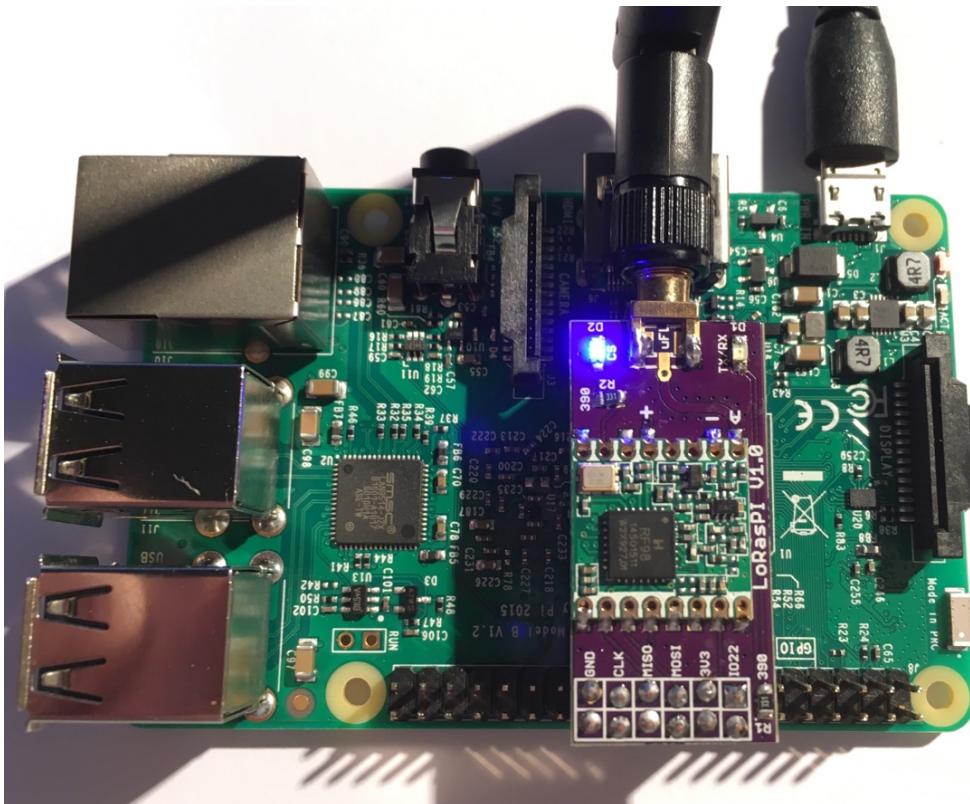

(RPI 1 Models A and B stop here)

EEPROM	ID_SD	27	28	ID_SC	EEPROM
5	N/A	29	30	GND	
6	N/A	31	32		12
13	N/A	33	34	GND	
19	N/A	35	36	N/A	16
26	N/A	37	38	Digital IN	20
	GND	39	40	Digital OUT	21

# THE LORASPI HAT

- The LoRasPI hat from  
<https://github.com/hallard/LoRasPI>

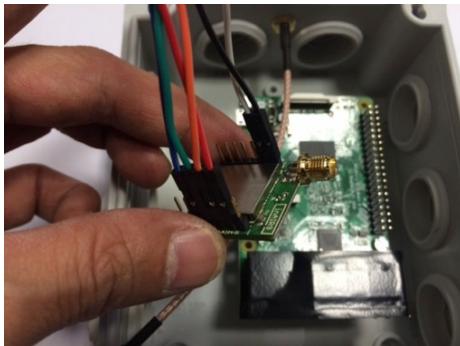

# THE WAZIHAT PCB

- We also have a simple RFM95 breakout for the gateway
- Contact A. Rahim (arahim"at"fbk.eu) for more information

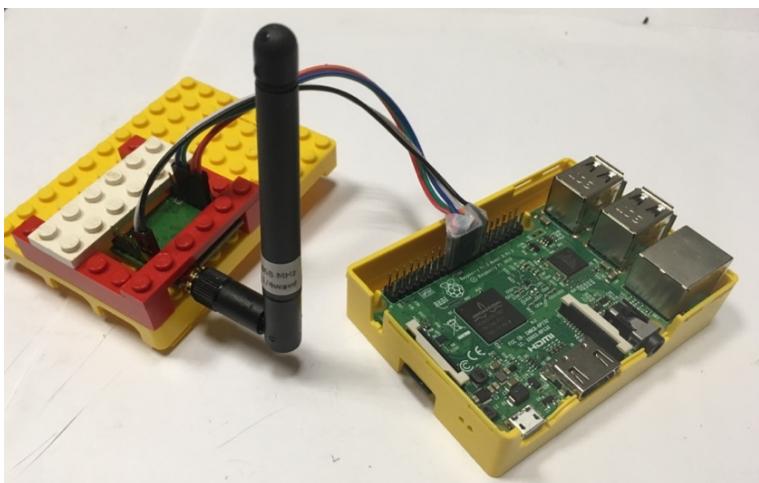

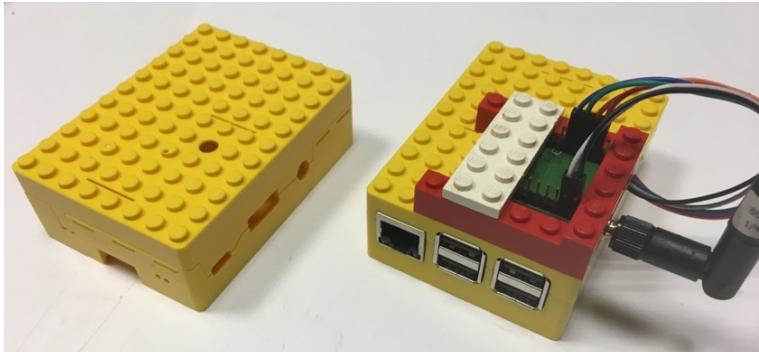

The short WAZIHAT version can be used for end-device as well

# PUT IT IN A BOX (1)

You can have a more integrated version, with a box for outdoor usage and PoE splitter to power the Raspberry with the Ethernet cable. See how we also use a DC-DC converter to get the 5V for the RPI.

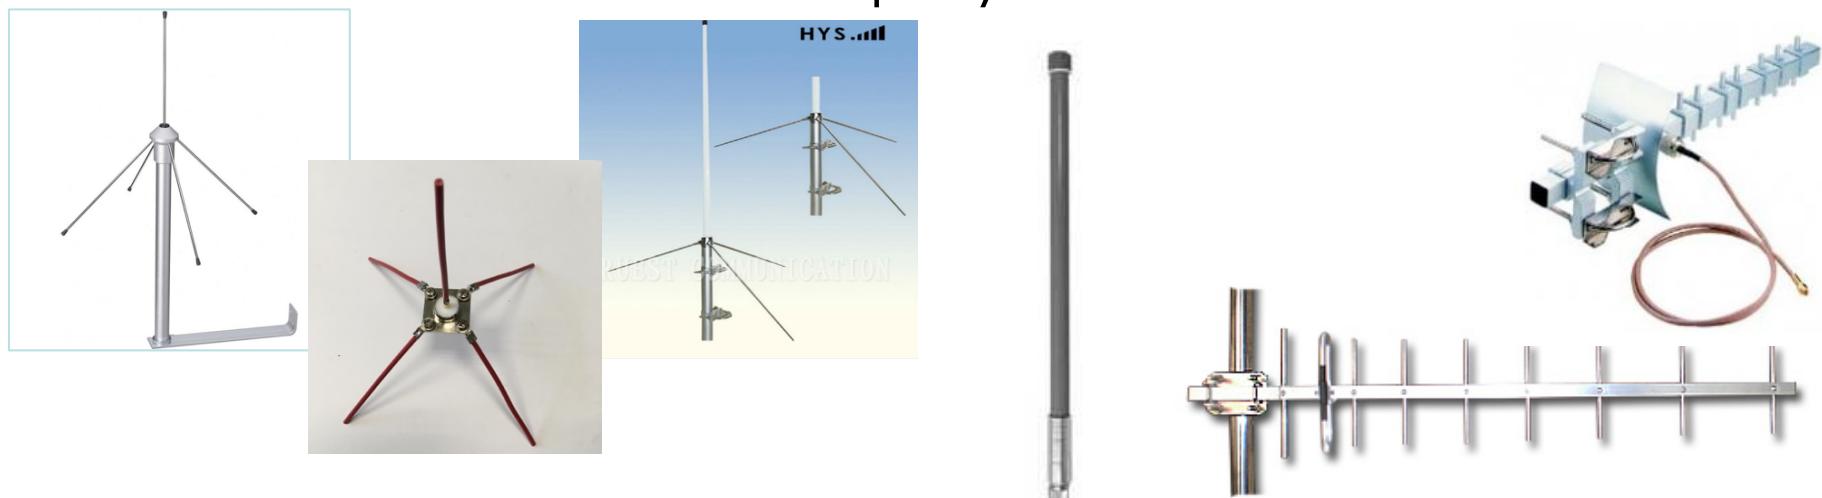

# PUT IT IN A BOX (2)

A simple, cheap and funny box is also very suitable for an indoor gateway. Actually, indoor deployment is probably the best option with an outdoor antenna as it will be shown in next slides.

# ANTENNAS FOR GATEWAY

- Antennas for gateways can be placed on a building, at a high location.
- You can easily use ground plane or dipole antennas (e.g. sleeve dipole). More complex high gain antenna or a directional Yagi antenna can be purchased depending on your budget and whether the deployment allows it.

# USING A CABLE ANTENNA

- Using an extension coaxial cable between the antenna and the radio module greatly ease the deployment of the gateway **but:**
  - Take a good quality cable (e.g. RG58 minimum) to limit attenuation
  - The antenna cable should not be too long to avoid high attenuation: 2m-5m
  - A simple  $\frac{1}{4}$  wave monopole antenna WILL NOT provide good performance, TAKE a sleeve dipole if you need something compact

Look at the antenna cable tutorial for instructions on how to build your own cable (with adequate connectors) at the correct length.

# ANTENNA WITH A COAXIAL CABLE

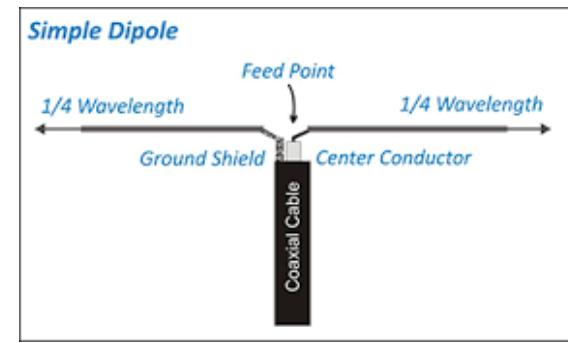

- At the end of a coaxial cable, it is possible to connect a ground plane antenna (usually  $\frac{1}{4}$  wave) or a  $\frac{1}{2}$  wave dipole antenna.

Ground plane

Sleeve dipole

Simple dipole

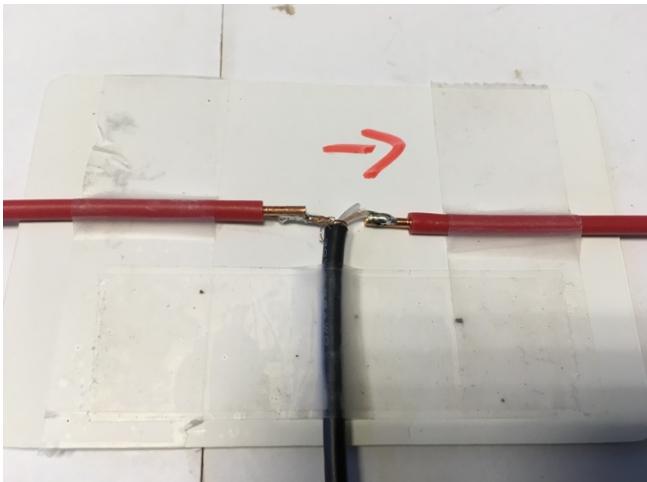

More complex:  
collinear,  
array,...

- Some of them are easy to build (ground plane and simple dipole) and there are many tutorials.

# SIMPLE $\frac{1}{2}$ WAVE DIPOLE ANTENNA

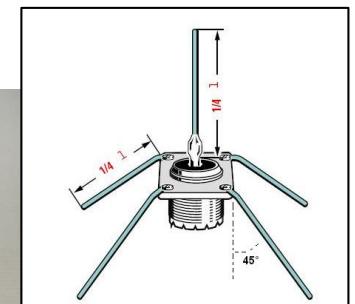

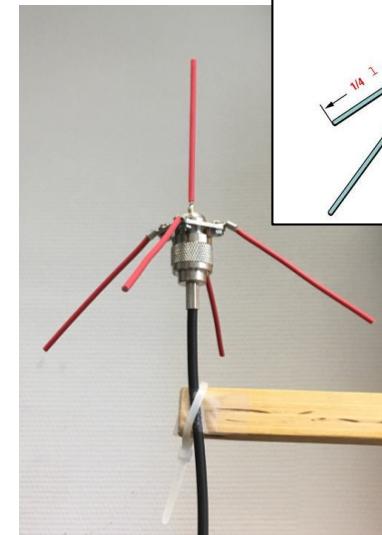

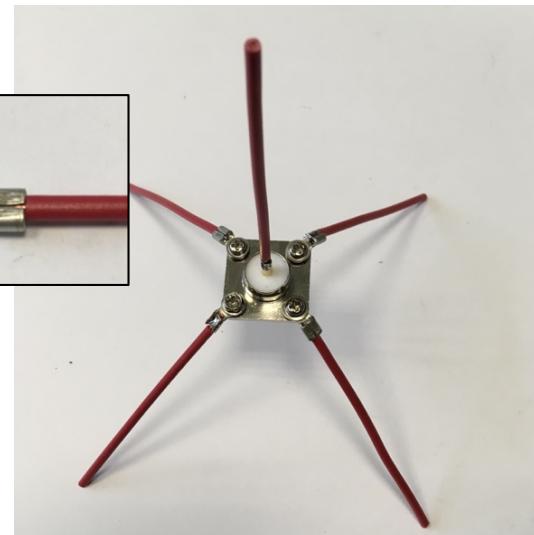

- A very simple dipole can be made with 2 pieces of  $\frac{1}{4}$  wave wires.  $\frac{1}{4}$  wave in 868MHz is about 8.2cm.

- There is no balun here but it is still better than the  $\frac{1}{4}$  wave monopole if a coaxial cable is used
- You can buy a 3m RG58 cable (SMA-m to SMA-f for instance), keep the male side, cut the female side and solder the core conductor and the braid as shown.

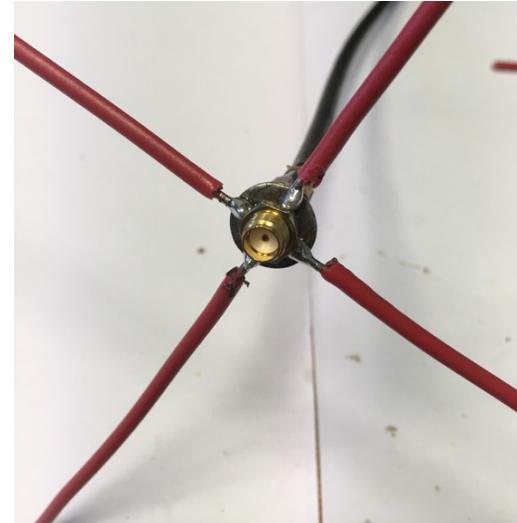

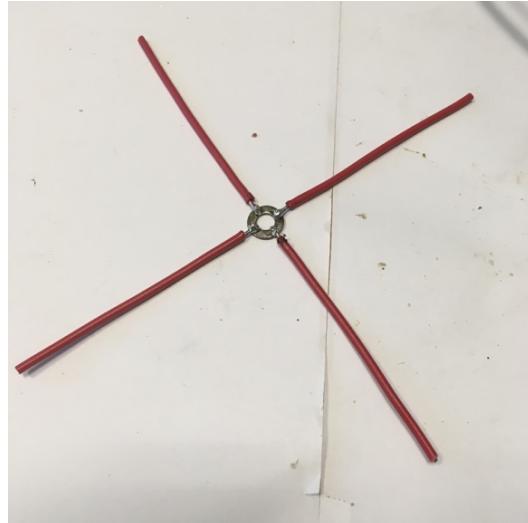

# SIMPLE $\frac{1}{4}$ WAVE GROUND PLANE ANTENNA

- The ground plane antenna can be made with 5 pieces of  $\frac{1}{4}$  wave wires.  $\frac{1}{4}$  wave in 868MHz is about 8.2cm.

- You can buy a 3m-5m RG58 cable with an SMA-male at one end and a male N-connector at the other end. Or build your own cable.

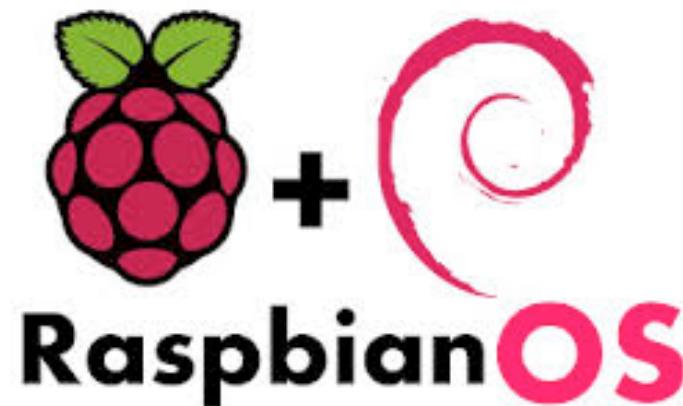

- With an existing SMA-m/SMA-f cable, you can also build a ground plane antenna by adding 4 radiant wires to the  $\frac{1}{4}$  wave monopole.

- This is a cheaper solution for sensing devices

## GETTING, COMPILING & INSTALLING THE SOFTWARE

# FLASHING THE OS

<http://cpham.perso.univ-pau.fr/LORA/WAZIUP/raspberrypi-jessie-WAZIUP-demo.dmg.zip>

- An SD card image with a Raspberry Raspbian Jessie version is provided.
- You will need an 8GB SD card. Be careful, some SD cards will not work. This one has been successfully tested. It has to be class 10.
- Look at  
<https://www.raspberrypi.org/documentation/installation/installing-images/> to see the procedure depending on your OS. 7948206080 bytes should be written, otherwise you may have a problem.
- Once flashed, insert the SD card and power-up the Raspberry-based gateway.

# GATEWAY WEB ADMIN INTERFACE (1)

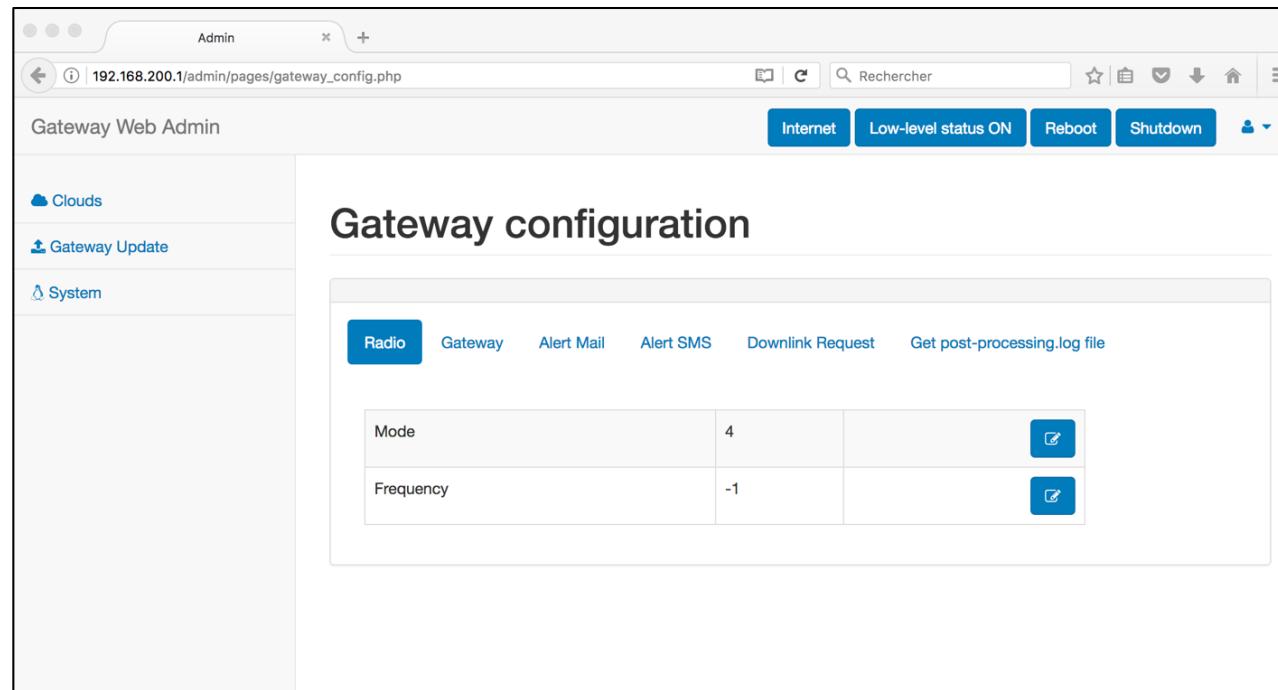

---

- ❑ A gateway web admin interface has been added to the latest version
- ❑ Note that the SD card image includes the web admin interface installed, so you may skip the installation procedure (but it is strongly advised to update)
- ❑ To install the web admin interface, check if you have the `gw_web_admin` folder in your `lora_gateway` folder
- ❑ If you don't, then update to the latest version
- ❑ Then, go into `gw_web_admin` and run `install.sh`
  - ❑ `cd gw_web_admin`
  - ❑ `sudo ./install.sh`
- ❑ Web admin interface tutorial:  
<https://github.com/CongducPham/tutorials/blob/master/Low-cost-LoRa-GW-web-admin.pdf>

# GATEWAY WEB ADMIN INTERFACE (2)

□ <http://192.168.200.1/admin>

- Login: admin
- Password: loragateway

The screenshot shows a web browser window titled "Admin" with the URL "192.168.200.1/admin/pages/gateway\_config.php". The page is titled "Gateway configuration". On the left, there is a sidebar with "Clouds", "Gateway Update", and "System". The main content area has tabs for "Radio", "Gateway", "Alert Mail", "Alert SMS", "Downlink Request", and "Get post-processing.log file". Under the "Radio" tab, there is a table with two rows: "Mode" (value: 4) and "Frequency" (value: -1). Each row has an edit icon on the right.

# WEB ADMIN FEATURES

---

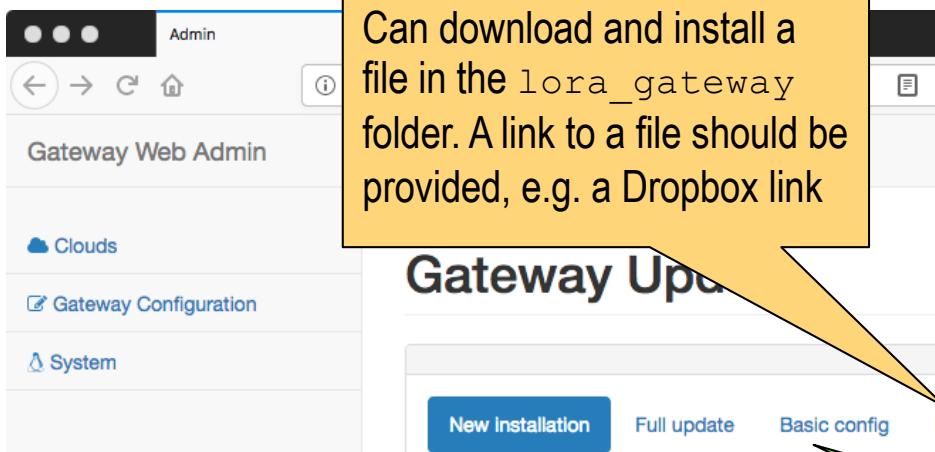

- Currently, you can use the web admin to:
  - Update your gateway with the latest github version while preserving your configuration files
  - Perform the basic configuration procedure.
  - Configure the gateway as WiFi client to connect to a WiFi network
  - Test Internet connectivity
  - Easily reboot and shutdown your gateway
    - Be carefull, if you shut down the gateway, you need to physically access the gateway to power it on again
  - Change LoRa mode and frequency
  - Set your gateway id and configure alerting system (mail, SMS)
  - Change the WiFi SSID and password
  - Enable/Disable local AES decryption
  - Enable/Disable some selected clouds such as WAZIUP and ThingSpeak
  - For ThingSpeak, you can specify a new write key
  - For WAZIUP, you can specify the project name, the organization name and the service tree

# GATEWAY UPDATE

- The gateway must be updated to the latest version.
- Internet access for the gateway is necessary
- The update procedure can easily be done with the web admin interface, connect to the gateway WiFi first
- The update steps are
  - 1 Full Update
  - 2 Basic Config
  - 3 Update Web Interface

# GATEWAY UPDATE PAGE

## ☐ Gateway update section

## Gateway Upd...

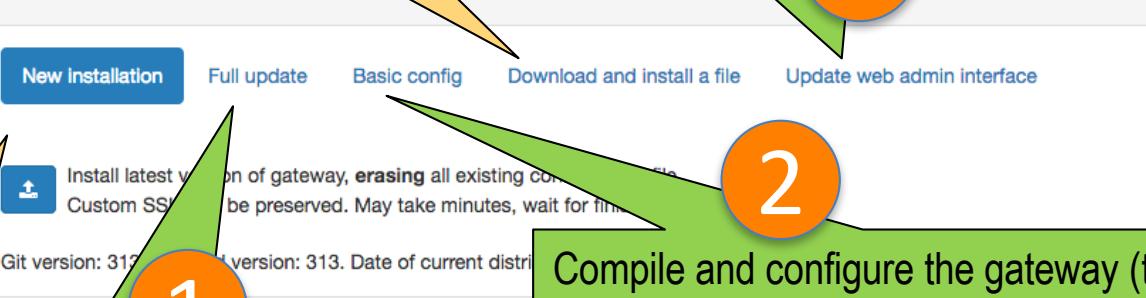

Install a new gateway by removing the existing `lora_gateway` folder, all existing configuration files will be overwritten.

If you install a new gateway with our SD card image, you can use this option.

Update with latest version on github, all your configuration files will be kept. This is the recommended option.

Update the web admin interface after an update of the distribution to install the last version of the web admin interface.

**It is recommended to run Update web admin right after Full update or New installation**  
Then reload the page.

1

Compile and configure the gateway (to set the gateway id & the WiFi access point SSID). This is also required if you install a new gateway using the provided SD card image. **It is recommended to run Basic config right after Full update or New installation**

3

2

# SOFTWARE VERSION NUMBER

## Gateway Update

New Installation    Full update    Basic config    Download and install a file    Update web admin interface

Install latest version of gateway, **erasing** all existing configuration file.  
Custom SSID will be preserved. May take minutes, wait for finish notification.

Git version: 313. Installed version: 313. Date of current distribution is 2018-06-21 16:28:07.326390425 +0200

- The software version number on github and the installed version number are displayed
- Click on **Internet** to obtain the latest software version number on github

Internet connection successful. github version number has been obtained.

Internet

Low-level status ON

Reboot

Shutdown

# GATEWAY ACCESS & CONFIGURATION INTERFACES

---

- There are 2 interfaces
  - The web admin interface
  - The command line interface that needs ssh
- The web interface is sufficient for most users
  - Easy basic configuration and easy update
  - Pre-defined cloud configuration
  - dedicated tutorial:  
<https://github.com/CongducPham/tutorials/blob/master/Low-cost-LoRa-GW-web-admin.pdf>
- The command line interface has some more options and can easily be extended
- We are going to describe the command line interface and some of the gateway's internal

# SSH TO THE GATEWAY

---

- ❑ The Raspbian image sets the Raspberry for DHCP on wired Ethernet and as a WiFi access point.
- ❑ If you connected the gateway to your LAN or laptop using wired Ethernet then the gateway will be assigned an IP address. Use this address to connect with SSH to the gateway
- ❑ You can use Angry IP Scanner (<http://angryip.org/>) to know the assigned address
- ❑ Use `ssh pi@rpi_addr`, where `rpi_addr` is the IP address assigned to the gateway
- ❑ Login password is `loragateway` if you installed from the SD card image
- ❑ However, using the built-in WiFi access point is easier as shown in the next slide

# SSH TO THE GATEWAY WITH WiFi

- The gateway is also configured as a WiFi access point with address 192.168.200.1
- Select the WAZIUP \_ PI \_ GW \_ xxxxxxxxxxxx WiFi
- WiFi password is loragateway
- Then ssh pi@192.168.200.1
- Login password is loragateway

You can use an iOS or Android smartphone or tablet to connect to the gateway with an SSH client app! See next slide.

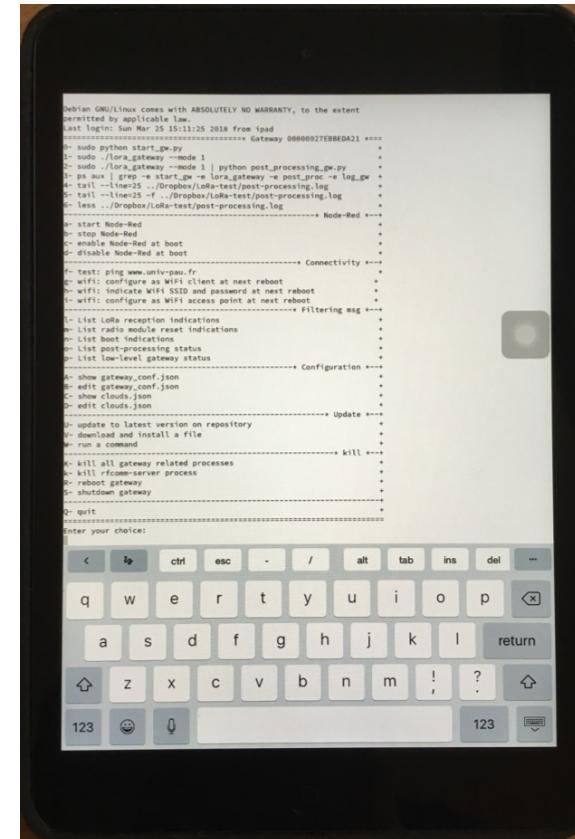

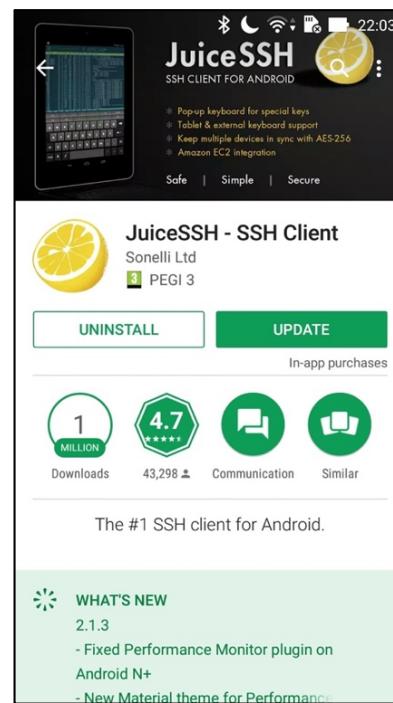

```
MacBookProRetina-de-Congduc-Pham:~ cpham$ ssh pi@192.168.200.1
pi@192.168.200.1's password:

The programs included with the Debian GNU/Linux system are free software;

```

# WAZIUP SMARTPHONE OR TABLET

- On iOS we tested Termius
- On Android we tested JuiceSSH

# GATEWAY'S SIMPLE COMMAND INTERFACE

---

- Once logged on the gateway, you may directly enter in a simple command interface
- This command interface consists in a cmd.sh shell script
- **In image versions after May 2017, this script is launched when you log into the gateway with ssh**
- If this happens, select Q and hit RETURN to quit this interface
- You should be in the lora\_gateway folder

```

pi@raspberrypi:~/lora_gateway $ ./cmd.sh

# DEFAULT GATEWAY CONFIGURATION

---

- ❑ The gateway software is **launched** when the Raspberry is powered on, i.e. booting
  - ❑ /home/pi/lora\_gateway/scripts/start\_gw.sh has been added in /etc/rc.local
  - ❑ start\_gw.sh can perform some tasks and finally calls /home/pi/lora\_gateway/start\_gw.py
  - ❑ start\_gw.py parses the configuration files to launch the low-level gateway and the post-processing stage
- ❑ The gateway works by default in LoRa mode 1 (BW=125kHz, SF=12) and listen on frequency 865.2MHz (see <https://github.com/CongducPham/LowCostLoRaGw#annex-a-lora-mode-and-predefined-channels>)
- ❑ The gateway\_conf.json file contains the gateway configuration

# GATEWAY\_CONF.JSON

---

- The gateway\_conf.json file contains the gateway configuration

```

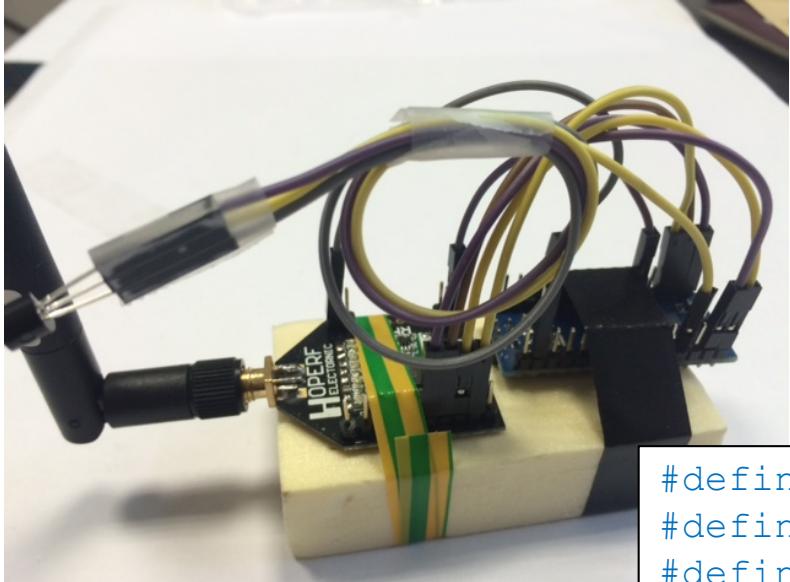

"radio_conf": {  
    "mode": 1,  
    "bw": 500,  
    "cr": 5,  
    "sf": 12,  
    "ch": -1,  
    "freq": -1  
},  
"gateway_conf": {  
    "gateway_ID": "000000XXXXXXDEF0",  
    "ref_latitude": "my_lat",  
    "ref_longitude": "my_long",  
    "wappkey": false,  
    "raw": false,  
    "aes": false,  
    "log_post_processing": true,  
    "log_weekly": false,  
    "dht22": 0,  
    "dht22_mongo": false,  
    "downlink": 0,  
    "status": 600,  
    "aux_radio": 0  
},
  
```

Set "mode" to -1 if you want to use bw, cr and sf parameters

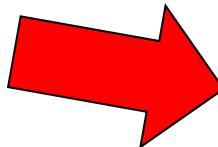

Set "ch" to a channel number if you don't want to use the default channel (which is channel 10 in the 868 band channel 05 in 900 band and channel 00 in the 433 band).

Set "freq" to a frequency, e.g. 865.2, if you want to specify a given frequency, "freq" has priority over "ch"

# DEFAULT CONFIGURATION

\!##TC/18.5

```
#define DEFAULT_DEST_ADDR 1
#define LORAMODE 1
#define node_addr 6
```

The default configuration in the Arduino\_LoRa\_Simple\_temp example is:

Send packets to the gateway (one or many if in range)  
LoRa mode 1 & Node short address is 6

The default gateway configuration is also LoRa mode 1

# CHECK THAT THE GATEWAY IS RUNNING

- Use option 3 of the text interface

```
BEGIN OUTPUT
Check for lora_gateway process

The software should be installed in a `lora_gateway` folder. Delete any previous folder.

```
> rm -rf lora_gateway
```

then

```
> mkdir lora_gateway  
> git clone https://github.com/CongducPham/LowCostLoRaGw.git  
> cp -r LowCostLoRaGw/gw_full_latest/* lora_gateway/
```

or

```
> svn checkout https://github.com/CongducPham/LowCostLoRaGw/trunk/gw_full_latest lora_gateway
```

# COMPILING THE GW SOFTWARE

```
> cd lora_gateway  
> make lora_gateway  
g++ -DRASPBERRY -DIS_RCV_GATEWAY -c lora_gateway.cpp -o lora_gateway.o  
g++ -c arduPi.cpp -o arduPi.o  
g++ -c SX1272.cpp -o SX1272.o  
g++ -lrt -lpthread lora_gateway.o arduPi.o SX1272.o -o lora_gateway
```

Edit radio.makefile for PABOOST setting. If inAir9B, RFM92W/FM95W, NiceRF1272, uncomment:

CFLAGS=-DPABOOST

If inAir9/inAir4, Libelium SX1272, leave commented:

#CFLAGS=-DPABOOST

If you have a RPI 2 or RPI3, then type:

```
> make lora_gateway_pi2
```

# USE A SCRIPT TO UPDATE THE GATEWAY

- Alternatively, the gateway can also be updated to the latest version with the `update_gw.sh` script (this script is called by the web interface).
- The first step is to get the latest version of the update script

```
> cd  
> svn checkout https://github.com/CongducPham/LowCostLoRaGw/trunk/gw_full_latest/scripts  
> cd scripts  
> ll  
total 48  
-rw-r--r-- 1 pi pi 3561 May 10 17:31 bashrc.sh  
-rwxr-xr-x 1 pi pi 10562 May 10 17:31 config_gw.sh  
-rw-r--r-- 1 pi pi 230 May 10 17:31 interfaces_ap  
-rwxr-xr-x 1 pi pi 99 May 10 17:31 mnt-dropbox

-rwxr-xr-x 1 pi pi 816 May 10 17:31 start_access_point.sh  
-rwxr-xr-x 1 pi pi 57 May 10 17:31 start_gw.sh  
-rwxr-xr-x 1 pi pi 673 May 10 17:31 stop_access_point.sh  
-rwxr-xr-x 1 pi pi 37 May 10 17:31 unmnt_dropbox  
-rwxr-xr-x 1 pi pi 1537 May 10 17:31 update_gw.sh
```

# UPDATING THE GATEWAY SOFTWARE

---

- It is also possible to get only this script
  - wget  
[https://raw.githubusercontent.com/CongducPham/LowCostLoRaGw/master/gw\\_full\\_latest/scripts/update\\_gw.sh](https://raw.githubusercontent.com/CongducPham/LowCostLoRaGw/master/gw_full_latest/scripts/update_gw.sh)
- Then type the following commands
  - rm -rf lora\_gateway
  - ./update\_gw.sh
- Removing any previous lora\_gateway folder triggers a full update
- The gateway will obtain the latest distribution from our github repository and will create a new lora\_gateway folder
- Next periodic updates without deleting the existing lora\_gateway folder, i.e. preserving existing configuration files, will be presented later on

# CONFIGURING THE GATEWAY

- ❑ Go into the scripts folder in the newly created lora\_gateway folder
- ❑ Run the basic\_config\_gw.sh script
  - ❑ ./basic\_config\_gw.sh
- ❑ The script will get the hardware address of the gateway to define the gateway'id, using the last 5 bytes of the MAC address
  - ❑ ifconfig

```
[pi@raspberrypi:~ $ ifconfig
eth0      Link encap:Ethernet HWaddr b8:27:eb:79:5c:47
          inet addr:10.0.13.185  Bcast:10.0.13.255  Mask:255.255.255.0
          inet6 addr: fe80::ba27:ebff:fe79:5c47/64 Scope:Link
            UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
            RX packets:3500 errors:0 dropped:0 overruns:0 frame:0
```

- ❑ It will also compile the low-level gateway software, remember to check compilation options of radio.makefile
- ❑ If you need advanced configuration, use config\_gw and follow the instructions as shown in the next slides **otherwise you are all done**

# ADVANCED CONFIGURATION ONLY (1)

```
*****  
*** compile lora_gateway executable Y/N ***  
*****
```

Enter Y

```
*****  
*** create log symb link to ~/Dropbox/LoRa-test Y/N ***  
*****
```

Enter Y

```
*****  
*** configure hostapd.conf Y/N ***  
*****
```

Enter Y

```
*****  
*** configure a newly installed hostapd/dnsmasq package Y/N ***  
*****
```

Enter N

```
*****  
*** configure bluetooth network name Y/N ***  
*****
```

Enter N

```
*****  
*** install DHT22 support Y/N ***  
*****
```

Enter Y

# ADVANCED CONFIGURATION ONLY (2)

```
*****  
*** edit gateway_conf.json now? Y/N ***  
*****
```

Enter N

```
*****  
*** activate DHT22 MongoDB Y/N/Q ***  
*****
```

Enter Q

```
*****  
*** edit LoRa data MongoDB local storage option? Y/N ***  
*****
```

Enter N

```
*****  
*** run gateway at boot Y/N ***  
*****
```

Enter Y

```
*****  
*** check configuration (recommended) Y/N ***  
*****
```

Enter N

```
*****  
*** reboot Y/N ***  
*****
```

Enter N

# GATEWAY'S ID

- The gateway's ID is derived from the RPI MAC address, using the last 5 bytes

```
pi@raspberrypi:~ $ ifconfig
eth0      Link encap:Ethernet HWaddr b8:27:eb:79:5c:47
          inet addr:10.0.13.185 Bcast:10.0.13.255 Mask:255.255.255.0
          inet6 addr: fe80::ba27:ebff:fe79:5c47/64 Scope:Link
            UP BROADCAST RUNNING MULTICAST MTU:1500 Metric:1
            RX packets:3500 errors:0 dropped:0 overruns:0 frame:0
```

- Here the gateway's ID is 00000027EB795C47
- This information is stored in gateway\_id.txt and in gateway\_conf.json
  - "gateway\_conf": {  
 "gateway\_ID": "00000027EB795C47",  
 ...  
}
  - basic\_config\_gw.sh also builds the MD5 hash version of the gateway's ID and stores it in gateway\_id.md5
  - The ID is re-created at boot so that a newly installed gateway has the correct ID
  - It is recommended to use this default gateway ID

# START THE COMMAND INTERFACE

```
> ./cmd.sh
```

As you can see, the gateway id shown by the command interface is now correct

```
pi@raspberrypi:~/lora_gateway $ ./cmd.sh

# PERIODIC UPDATE PROCEDURE

---

- ❑ You can use option **U** to update from repository and still keep all your configuration files: gateway\_conf.json, clouds.json and key\*
- ❑ This simply call update\_gw.sh
- ❑ You can also install a single file with option **V** that will prompt for a URL
- ❑ You can enter a URL that has been provided by some administrator
- ❑ Example in the next slide

```

pi@raspberrypi:~/lora_gateway $ ./cmd.sh
=====
                                     * Gateway 00000027EB795C47 ====

# DOWNLOAD AND INSTALL A FILE (2)

---

- This feature is very useful for end-users to simply update some files on the gateway.
  - `gateway_conf.json` and `clouds.json`
  - `radio.makefile`
  - ...
- An administrator can write appropriate configuration files for the end-user and generate an URL to this file (with Dropbox for instance)
- The URL can be either be sent by mail or SMS to the end-user.
- The end-user has to simply log into the gateway (using an Android smartphone or tablet connecting to the gateway's WiFi) and select option **V** to enter the URL.
- The end-user will then just reboot the gateway with option **R** for the new configuration to run.

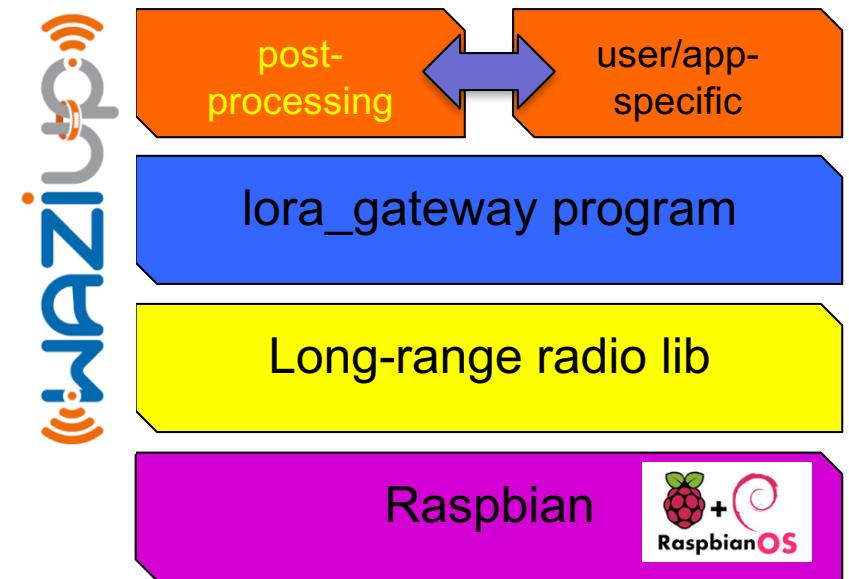

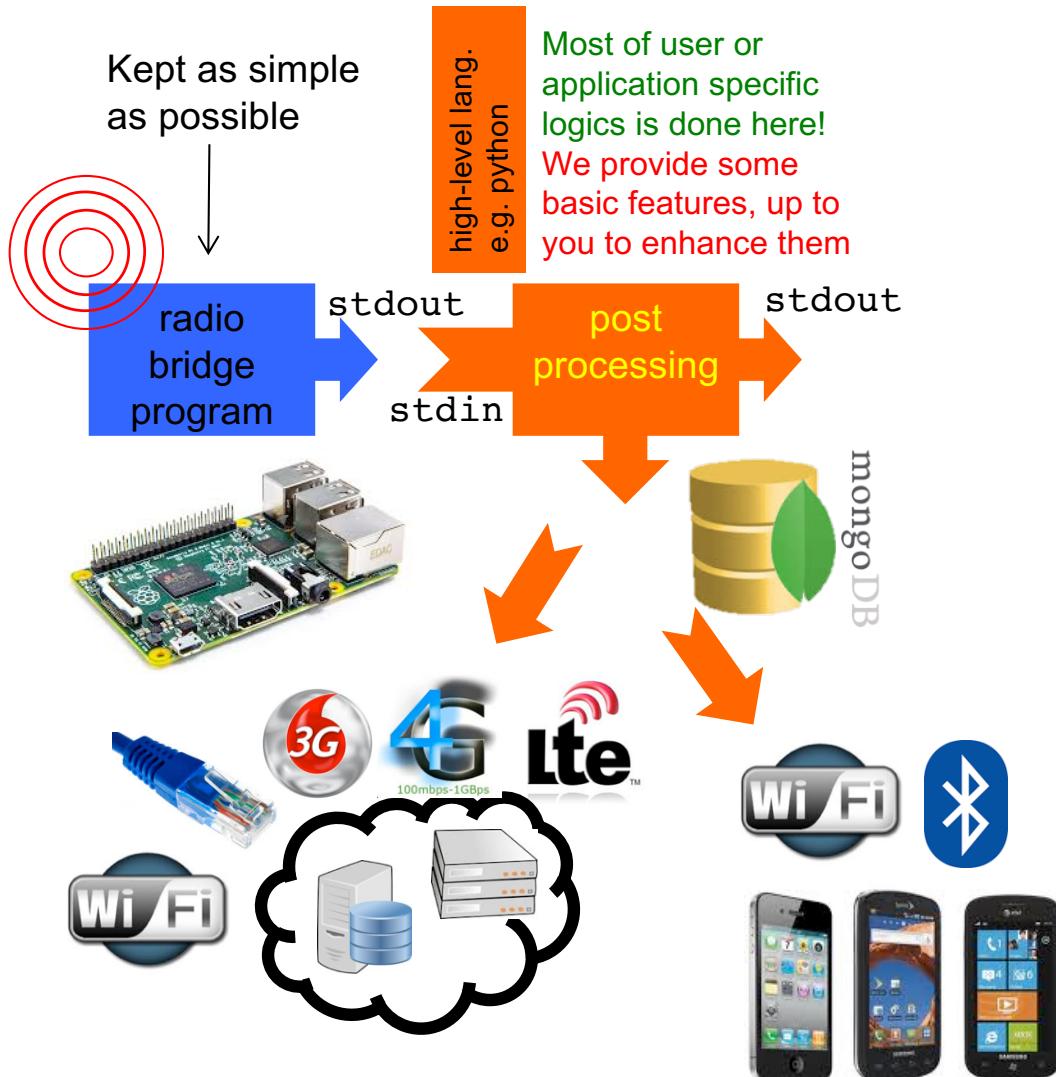

# DOWNLOAD AND INSTALL A FILE (3)

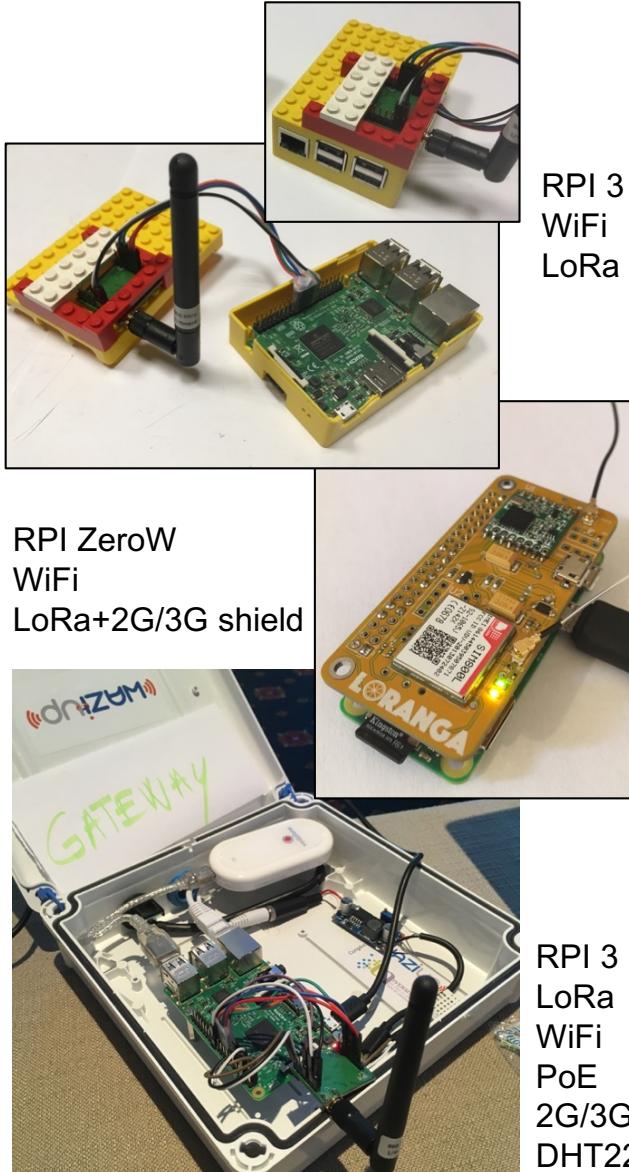

- System files can also be installed with option **W** that will prompt for a command

```
Enter your choice:  
W  
-----  
BEGIN OUTPUT  
Run a command  
Enter the command to run:  
sudo wget -O /etc/test.txt https://www.dropbox.com/s/mcmg4yeksr340c2/example-install-file.txt
```

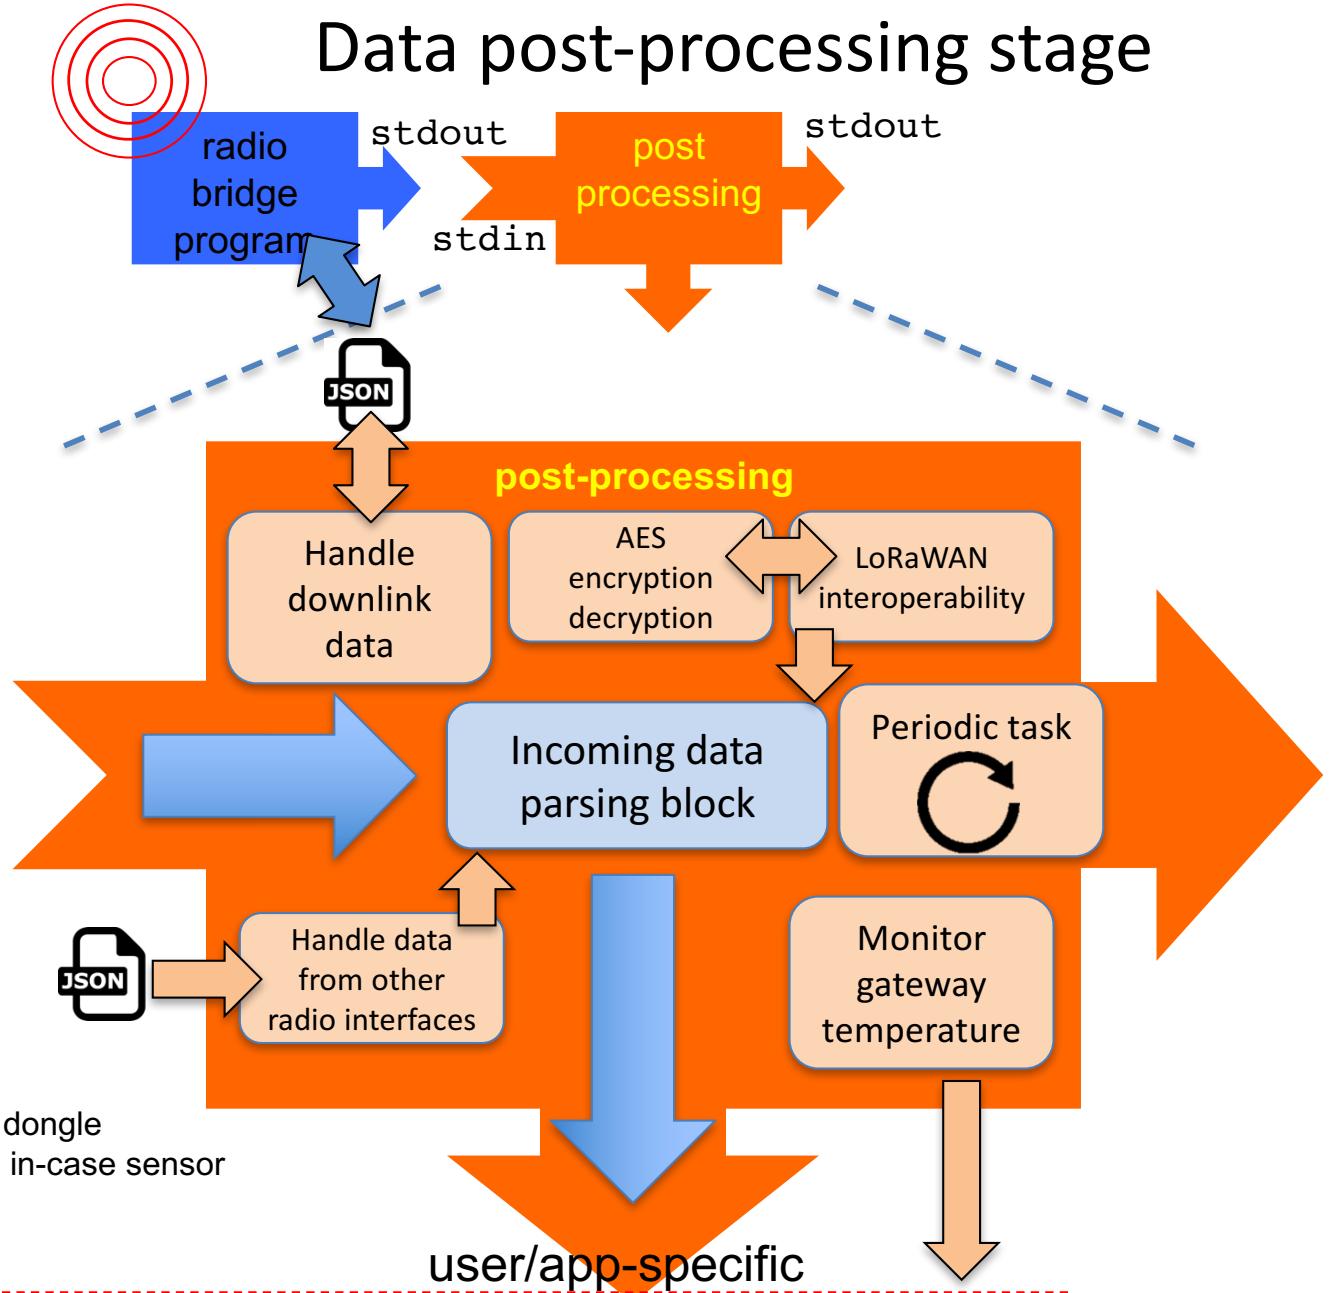

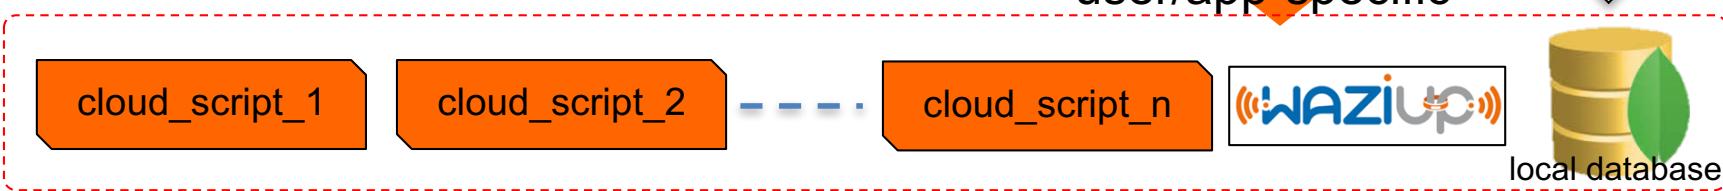

- Here, the previous example file will be installed in /etc under the name test.txt
- Like previously, the exact command can be sent to the end-user

# OUR LOW-COST GATEWAY ARCHITECTURE

### Cloud definition

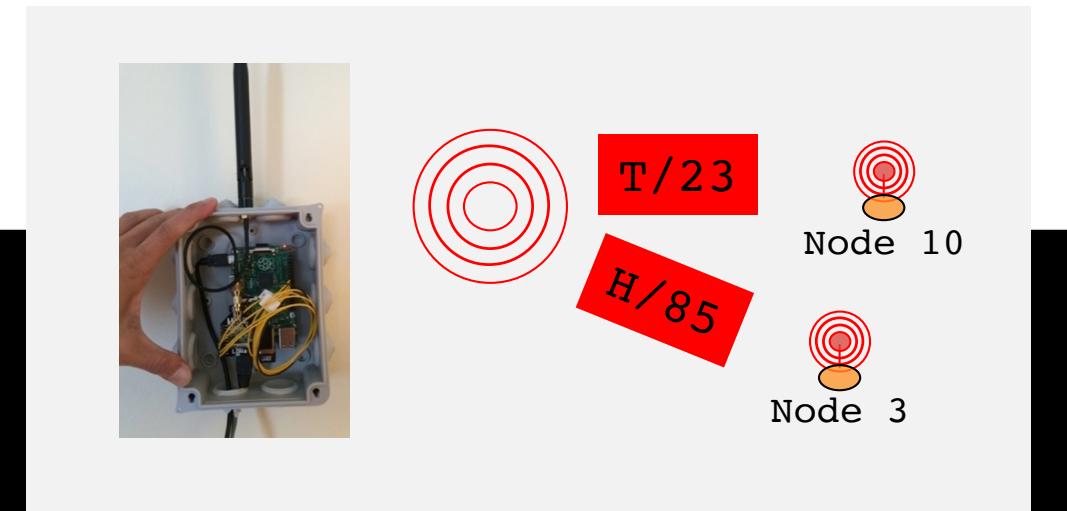

# STARTING THE GATEWAY

- Remember that the gateway software is **launched** when the Raspberry is powered on
- In the next 4 slides, we will show you some details that is useful to know but that you **DO NOT** need when launching a production gateway
- If you use our SD card image and powered on your Raspberry, then you can use option 3 as explained in slide 24 to see if the gateway is running, then use option K to kill all gateway-related process to test the next 4 slides.

# STARTING THE BASIC GATEWAY

```
> sudo ./lora_gateway
*****Power ON: state 0
Default sync word: 0x12
LoRa mode: 1
Setting mode: state 0
Channel CH_10_868: state 0
Set LoRa Power to M: state 0
Get Preamble Length: state 0
Preamble Length: 8
LoRa addr 1 : state 0

```

# GATEWAY TO CLOUD

Data received at the gateway can be pushed to IoT clouds. We provide python script examples for many IoT cloud platforms. Most of clouds with REST API can be easily integrated.

# USING

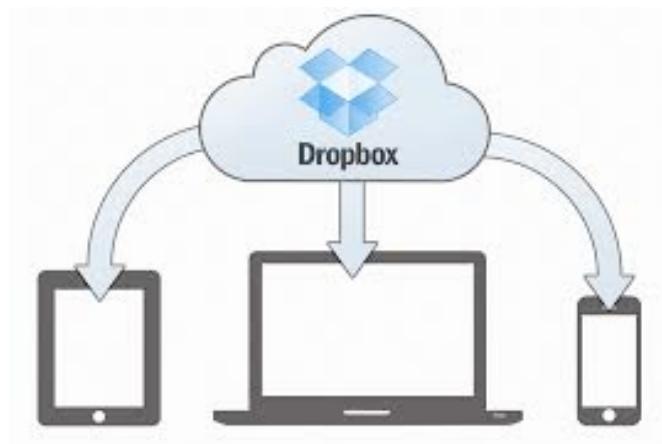

Dropbox

---

- A message starting with '\\$' is logged in a file 'telemetry.log' in a folder shared through Dropbox (if enabled)

```

...
```

\\$T/23  
  
Node 10

# PUSHING TO IOT DATA CLOUDS

- A message starting with '\!' is uploaded on a cloud
- clouds.json file defines enabled clouds

```
{  
    "clouds": [  
        {  
            "name": "Local gateway MongoDB",  
            "notice": "do not remove the MongoDB cloud declaration, just change en.  
            "script": "python CloudMongoDB.py",  
            "type": "database",  
            "max_months_to_store": 2,  
            "enabled": false  
        },  
        {  
            "name": "WAZIUP Orion cloud new API",  
            "script": "python CloudWAZIUP.py",  
            "type": "iotcloud",  
            "enabled": true  
        },  
        {  
            "name": "ThingSpeak cloud",  
            "script": "python CloudThingSpeak.py",  
            "type": "iotcloud",  
            "enabled": true  
        },  
        {  
            "name": "NodeRed flow",  
            "script": "python CloudNodeRed.py",  
            "type": "nodered",  
            "enabled": false  
        },  
        {  
            "name": "MQTT cloud",  
            "script": "python CloudMQTT.py",  
            "type": "MQTT on test.mosquitto.org",  
            "enabled": false  
        },  
        {  
            "name": "Firebase cloud",  
            "script": "python CloudFireBase.py",  
            "type": "jsoncloud",  
            "enabled": false  
        },  
        {  
            "name": "example template",  
            "script": "name of your script, preceded by the script launcher",  
            "type": "whatever you want FYI",  
            "server": "",  
            "login": "",  
            "password": "",  
            "folder": "",  
            "write_key": "",  
            "enabled": false  
        }  
    ]  
}
```

For each cloud, you have to provide a script and the launcher program (e.g. python)

Enabled clouds will be called by the post-processing stage

# EXAMPLE WITH WAZIUP CLOUD

---

- To use the WAZIUP cloud:

```
{  
    "name": "WAZIUP Orion cloud new API",  
    "script": "python CloudWAZIUP.py",  
    "type": "iotcloud",  
    "enabled": true  
},
```

- Edit and modify clouds.json according to your need
- CloudWAZIUP.py script will use information from key\_WAZIUP.py to configure data management for each organization
- Therefore you need to configure this file for each organization/gateway

# KEY\_WAZIUP.PY

```
#####
#server: CAUTION must exist
orion_server="http://api.waziup.io/api/v1"

#project name
project_name="waziup"

#your organization: CHANGE HERE
#choose one of the following: "DEF", "UPPA", "EGM", "IT21", "CREATENET", "CTIC", "UI", "ISPACE",

# THE WAZIUP CLOUD PLATFORM

□ [dashboard.waziup.io](http://dashboard.waziup.io)

The screenshot displays the WAZIUP Cloud Platform interface. On the left, a sidebar shows the domain "waziup-UPPA-TESTS2". The main area contains three sensor nodes:

- Node UPPA Sensor 6**: Shows a green card with a temperature gauge icon and the value **17.21 °C**.
- Node (UPPA\_Sensor3)**: Shows a green card with a temperature gauge icon and the value **21.43**.
- Node (UPPA\_Sensor10)**: Shows a red card with a temperature gauge icon and the value **23.97**.

On the right, a detailed view for **UPPA Sensor 6** is shown. It includes a "Temperature" section with a gauge at **17.21 °C** and a line graph, and a "Location" section featuring a map of France and surrounding regions.

# EXAMPLE: ThingSpeak

User: cpham

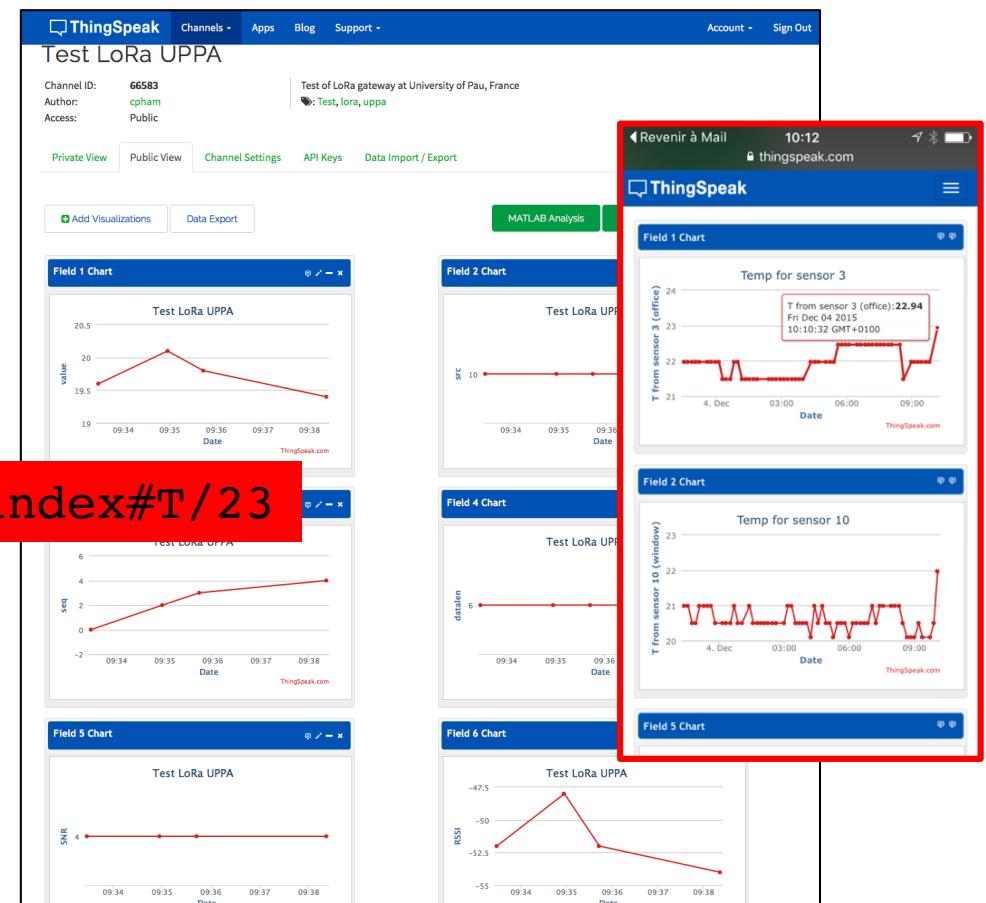

**Test LoRa UPPA**

Channel ID: 66583  
Author: cpham  
Test of LoRa gateway at University of Pau, France

Test, lora, uppa

\!write\_key#field\_index#T/23

# EXAMPLE: Firebase

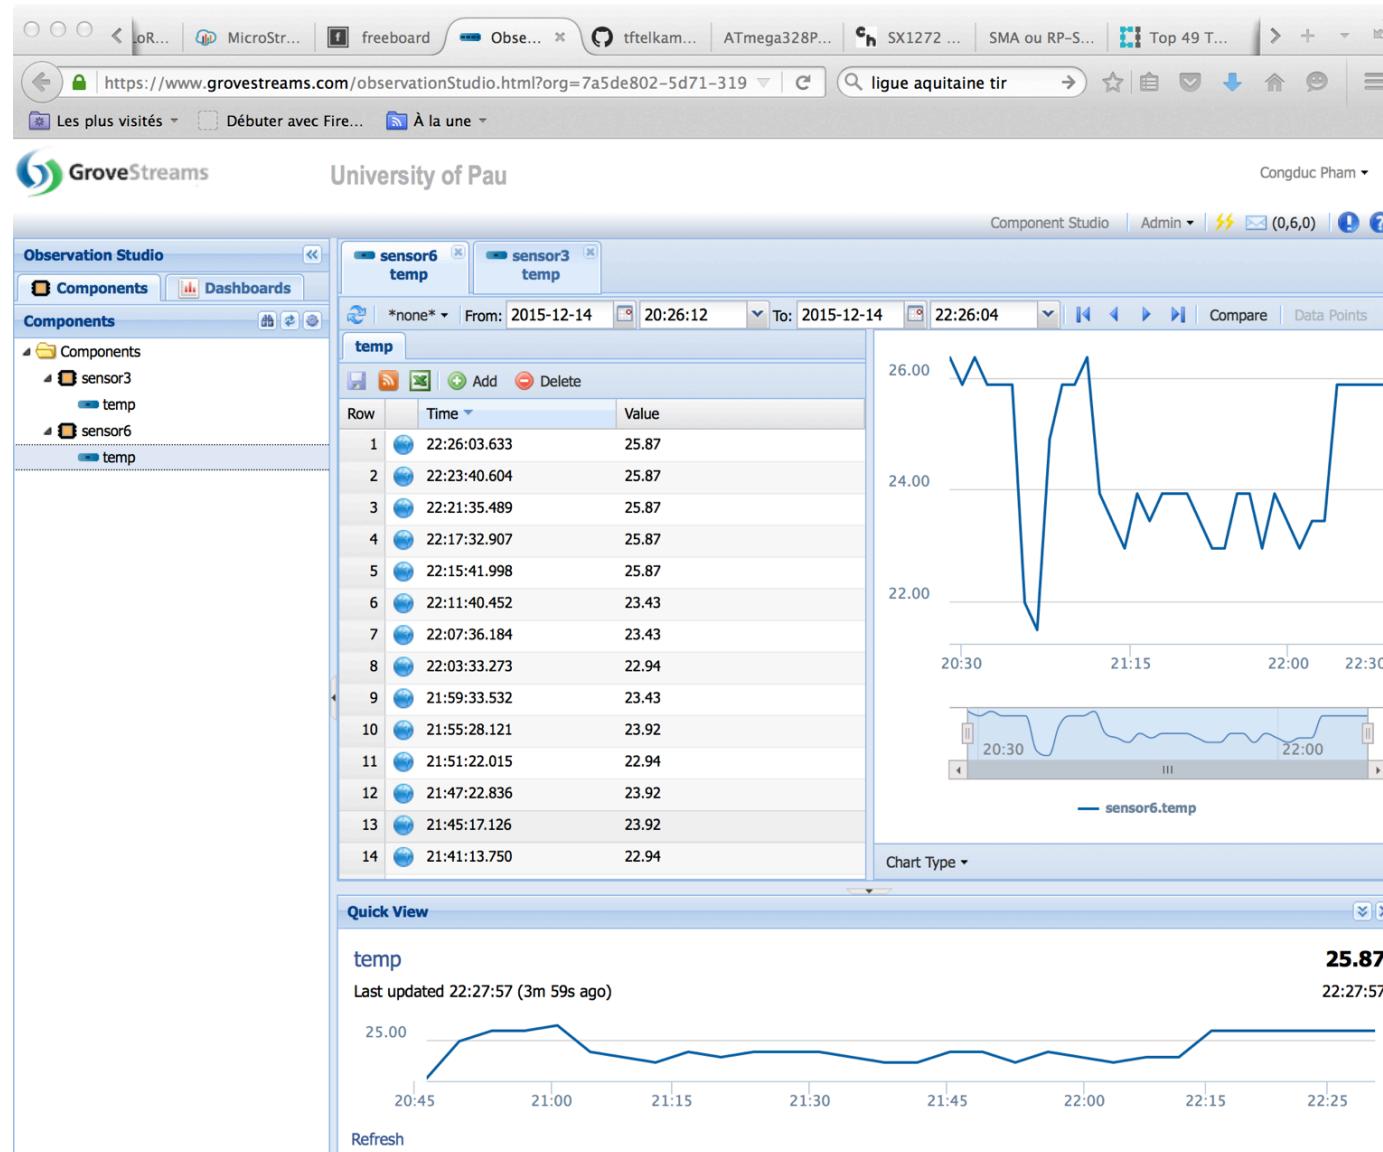

The screenshot shows the Firebase Realtime Database interface. The left sidebar has a 'Data' icon selected. The main area displays a tree structure under the path 'SWELTERING-TORCH-4818'. The structure includes 'LoRa', 'LIUPPA', 'RPIgateway', '2015-11-04', 'sensor3', and 'msg0'. The 'msg0' node contains the following data:

```
RSSI: -54
SNR: 8
date: "2015-11-04T10:18:12.254671"
info_str: "(src=3 seq=0 len=5 SNR=8 RSSI=-54) 2015-11-04T1..."
len: 5
seq: 0
src: 3
text: "H=85%"
```

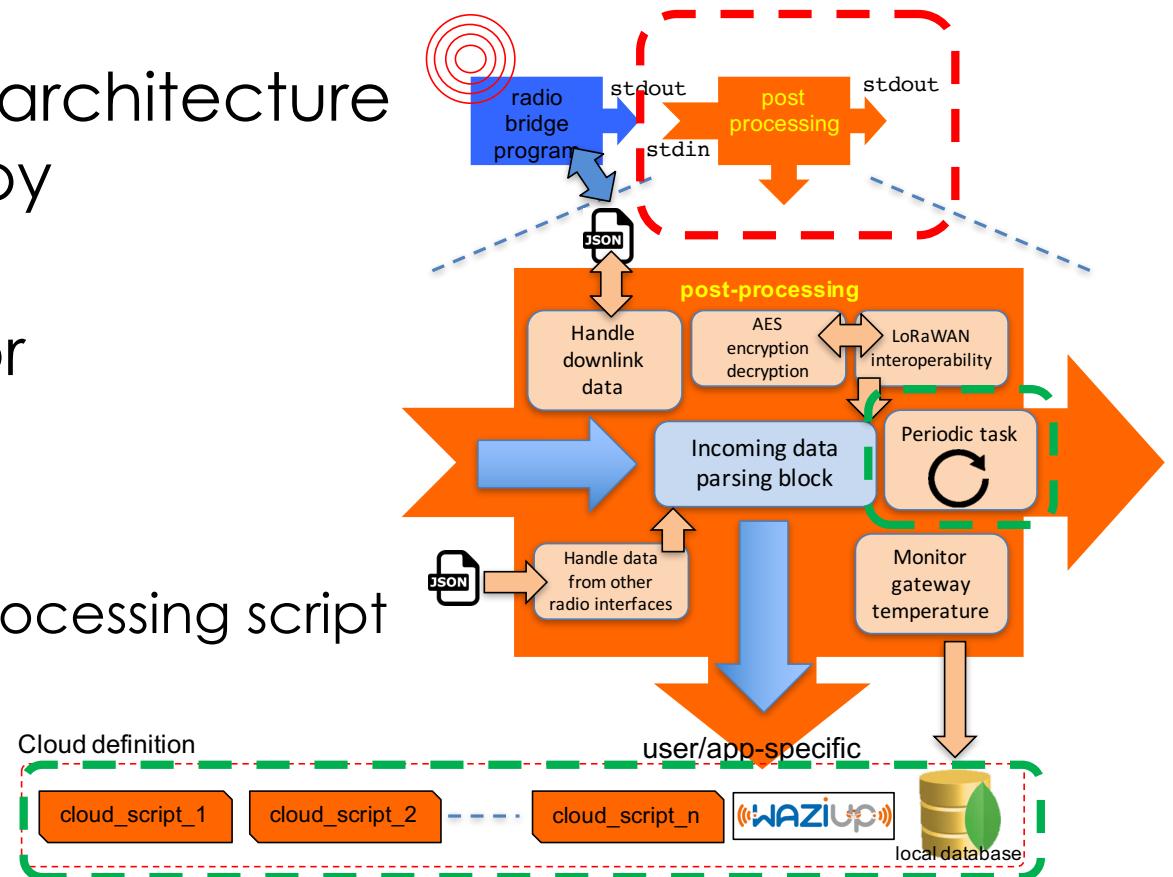

A legend in the top right corner defines the colors: yellow for 'Changed', green for 'Added', red for 'Deleted', and blue for 'Moved'.

# EXAMPLE: **GroveStreams**

# CUSTOMIZING/EXTENDING YOUR GATEWAY

- The flexible gateway architecture offers high versatility by customization
- There are 3 options for customization
- **The geek way**
  - Modify/extend post-processing script
- **The "smarter" way**
  - Add "cloud" scripts
    - On packet reception
  - Add periodic tasks
    - Independant from packet reception

# WRITE YOUR OWN CLOUD SCRIPT

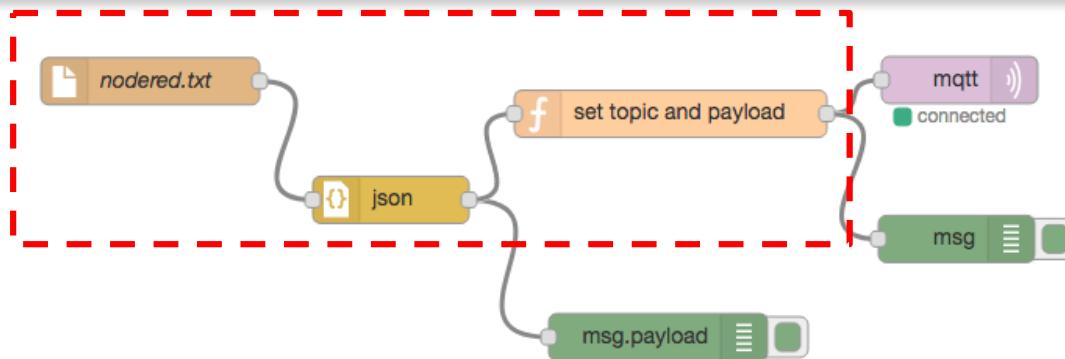

- Use our templates to write your own cloud script
  - CloudWAZIUP.py, CloudMongoDB.py,  
CloudThingSpeak.py, CloudGroveStreams.py,  
CloudNoInternet.py, CloudNodeRed.py, ...
- A cloud script is called with 5 arguments
  - ldata: the received data
    - e.g. #4#TC/21.5 as 1st argument (sys.argv[1] in python)
  - pdata: packet information
    - e.g. "1,16,3,0,10,8,-45" as 2nd argument (sys.argv[2] in python)
    - interpreted as dst,ptype,src,seq,len,SNR,RSSI for the last received packet
  - rdata: the LoRa radio information
    - e.g. "500,5,12" as 3rd argument (sys.argv[3] in python)
    - interpreted as bw,cr,sf for the last received packet
  - tdata: the timestamp information
    - e.g. "2016-10-04T02:03:28.783385" as 4th argument (sys.argv[4] in python)
  - gwid: the gateway id
    - e.g. 00000027EBBEDA21 as 5th argument (sys.argv[5] in python)

These parameters are passed to the script. It is up to the cloud script to use these parameters or not.

# EXAMPLE WITH NODE-RED

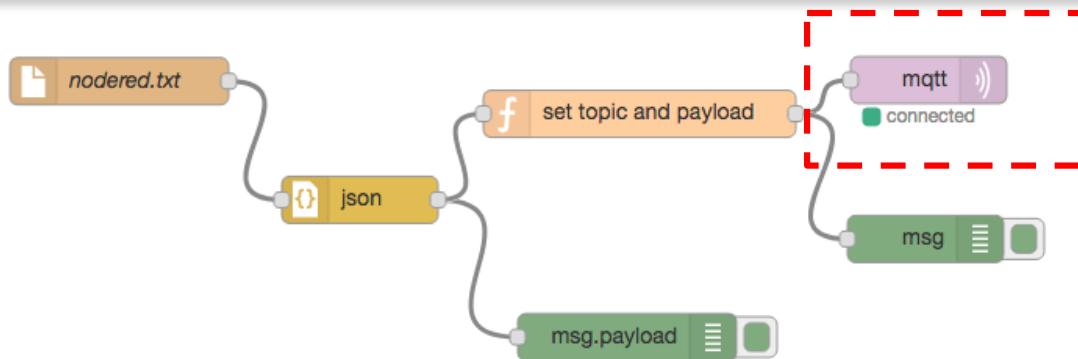

- ❑ CloudNodeRed.py shows how interface with Node-Red can be simply implemented to benefit from the facility offered by Node-Red
- ❑ We use key\_NodeRed.py to define 3 variables that will be used by CloudNodeRed.py
  - ❑ project\_name="waziup"
  - ❑ organization\_name="UPPA"
  - ❑ sensor\_name="Sensor"
- ❑ when a device which address is 2 sends "TC/22.5/HU/85" to the gateway, CloudNodeRed.py will generate the following json entries in nodered/nodered.txt file
  - ❑ { "source": "waziup\_UPPA\_Sensor2", "measure": "TC", "value": 22.5}
  - ❑ { "source": "waziup\_UPPA\_Sensor2", "measure": "HU", "value": 85}

# NODE-RED FLOW (1)

- The Node-Red flow is composed of a tail node that follows the nodered/nodered.txt file for new entries. Each entry will be converted into a json object with a json node. A function node will use the json entry to build a message as follows
  - `msg.topic=msg.payload.source+'/'+msg.payload.measure`
  - `msg.payload=msg.payload.value`
  - `return msg;`

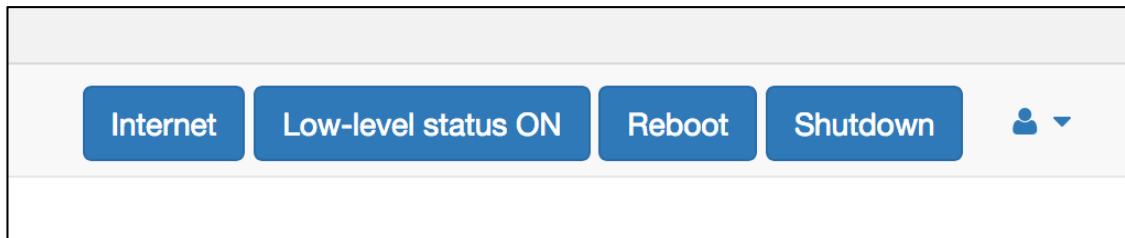

## NODE-RED FLOW (2)

- An MQTT node using the test.mosquitto.org broker will receive the messages with the topic defined as waziup\_UPPA\_Sensor2/TC and waziup\_UPPA\_Sensor2/HU
- It will then respectively publish 22.5 and 85 under these topics
- More information on:
  - [https://github.com/CongducPham/LowCostLoRaGw/blob/master/gw\\_full\\_latest/README-NodeRed.md](https://github.com/CongducPham/LowCostLoRaGw/blob/master/gw_full_latest/README-NodeRed.md)

# REBOOTING THE GATEWAY

- ❑ Your gateway is now updated and configured
- ❑ You can now reboot the gateway

- ❑ After reboot, check the WiFi SSID which now should meet your gateway's id
- ❑ In general, try to avoid unplugging power cable to shutdown your gateway. Use the web admin interface instead
- ❑ Your gateway is now ready to be deployed.

---

## STANDALONE GATEWAY

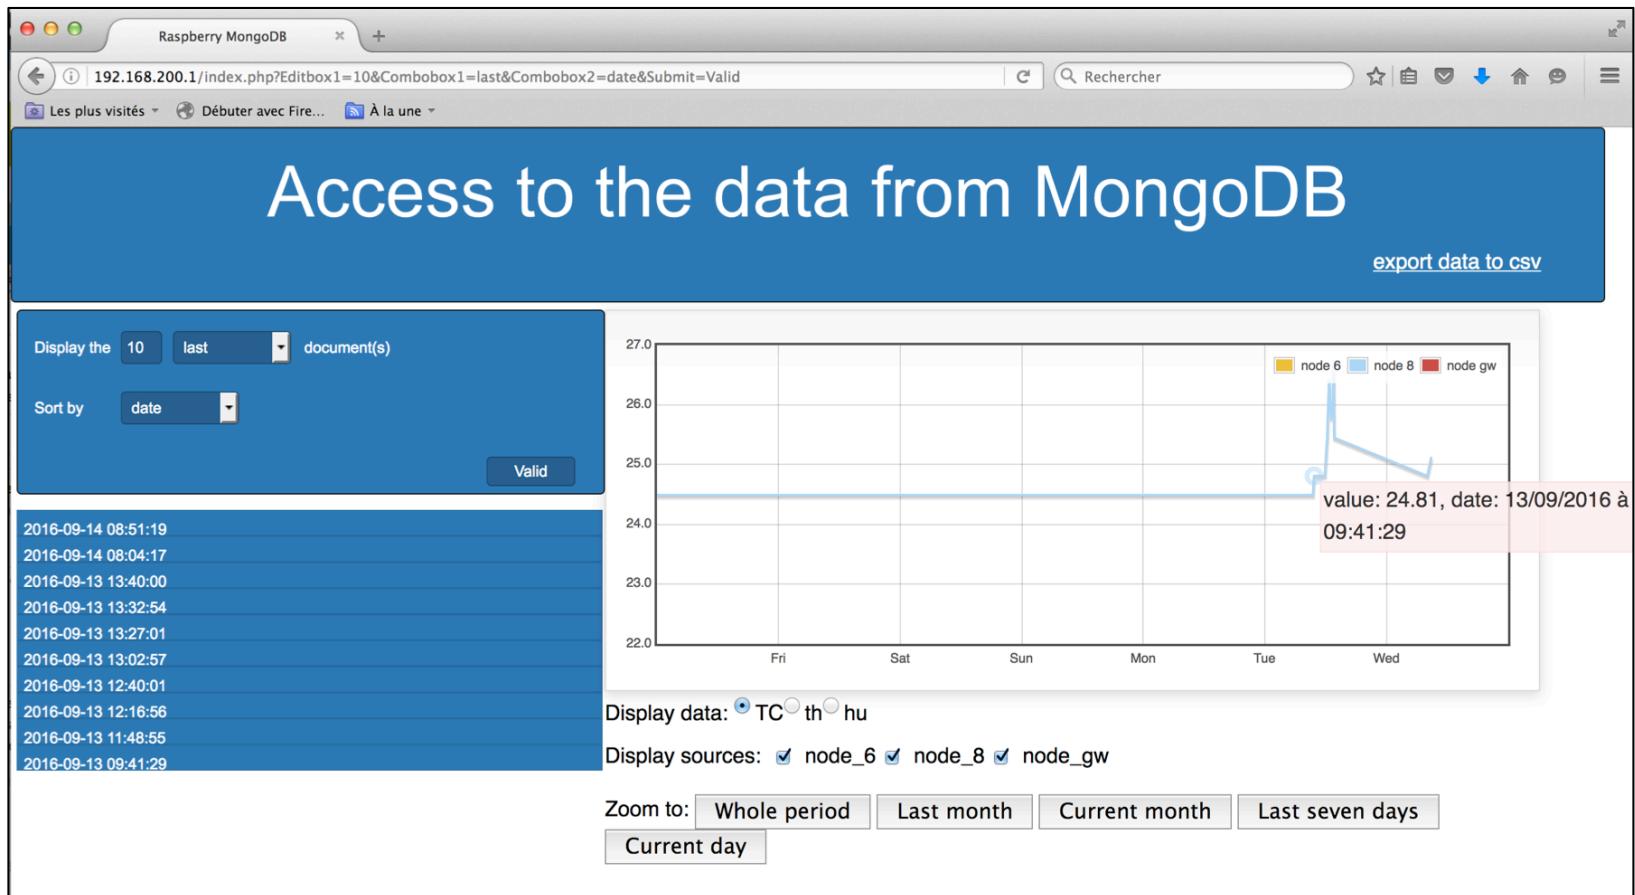

# CONNECT TO THE EMBEDDED WEB DATA SERVER

---

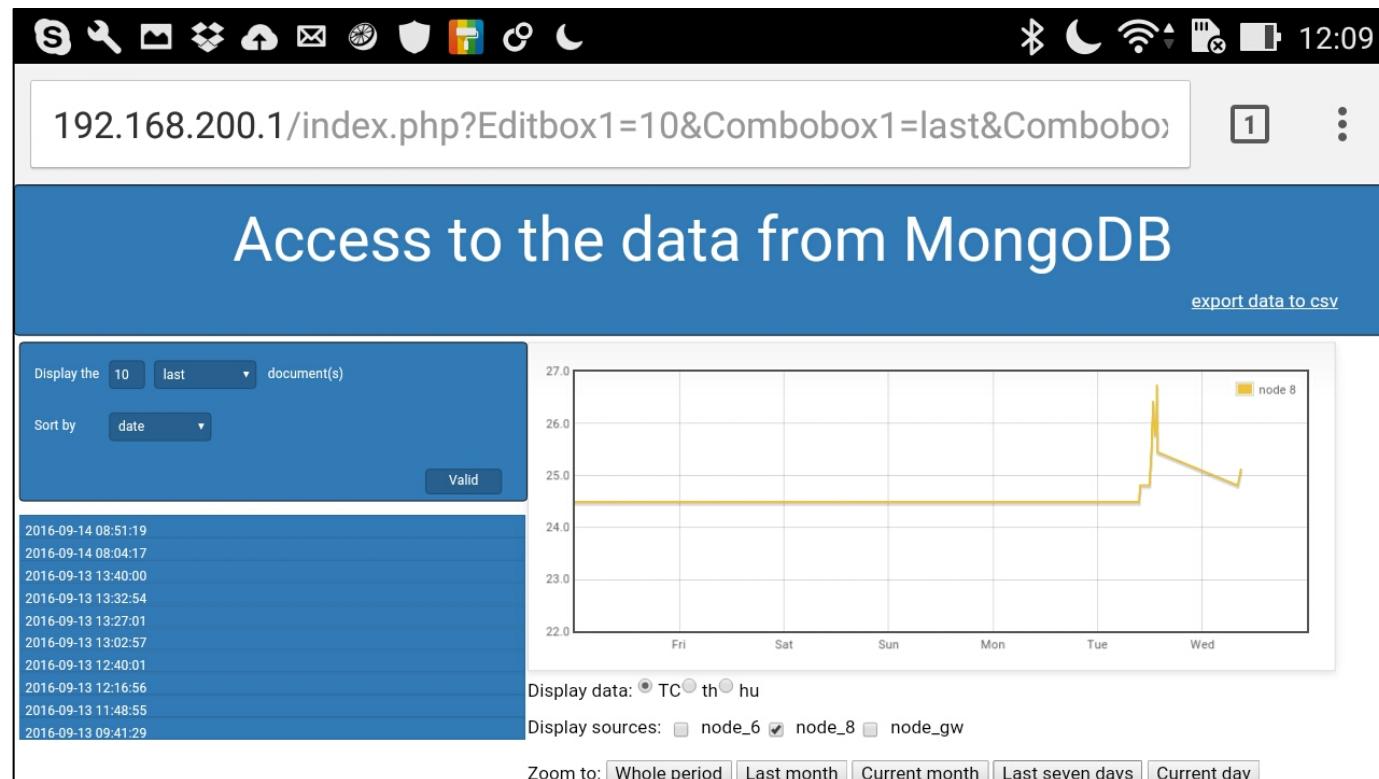

- ❑ Received data are also stored on the gateway if CloudMongoDB.py is enabled
- ❑ On the WiFi interface
  - ❑ Gateway address is 192.168.200.1
- ❑ On the Ethernet interface
  - ❑ Gateway address is the IP address assigned by the DHCP server (of your LAN or laptop)
- ❑ Choose any of these solutions and open a web browser to enter the gateway IP address in the URL bar
  - ❑ <http://192.168.200.1>

# DATA FROM THE LOCAL WEB SERVER

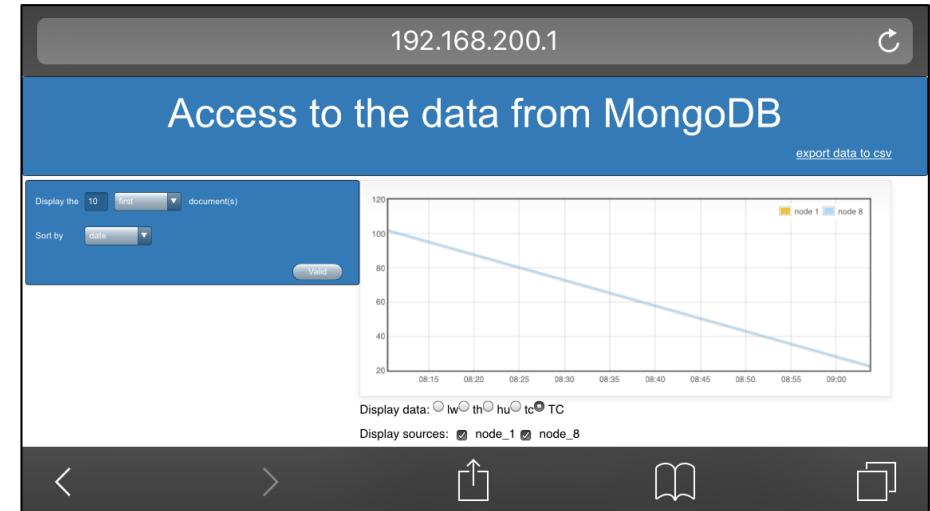

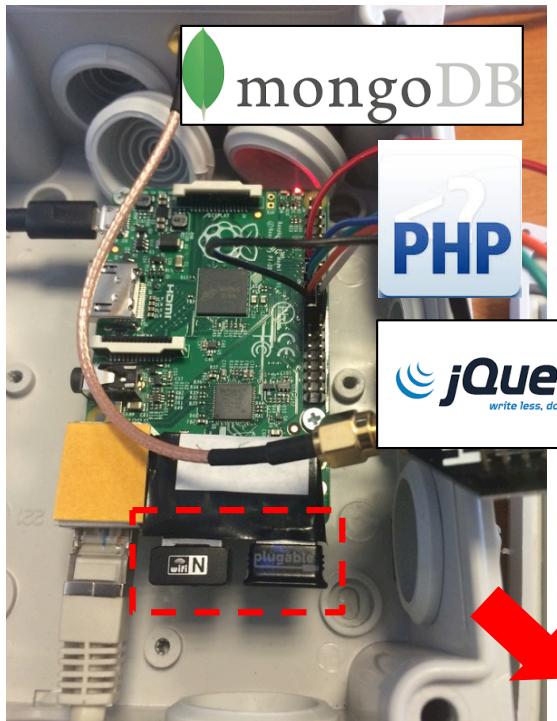

# VISUALIZE IT ON YOUR SMARTPHONE!

- Don't forget to join the WAZIUP\_PI\_GW\_xxxxxxxxxx WiFi

# RUNNING THE GATEWAY WITHOUT INTERNET ACCESS

## IMPROVING CASING AND ADDING PoE TO GATEWAY

# OVERVIEW OF THE PARTS

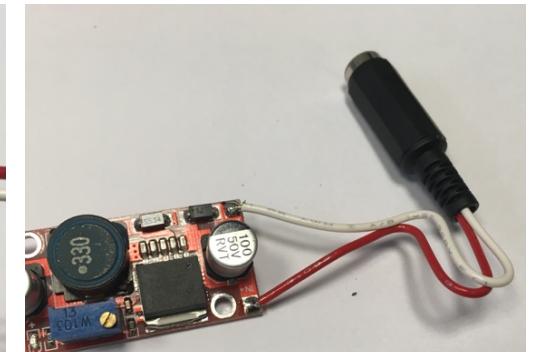

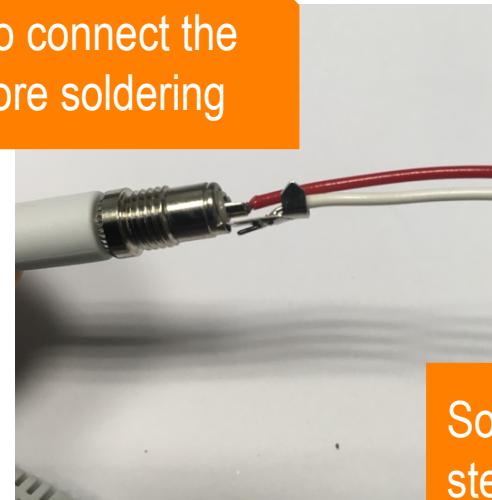

# FIXING THE RASPBERRY TO THE CASE

# PREPARE THE DC STEP-DOWN (LM2596)

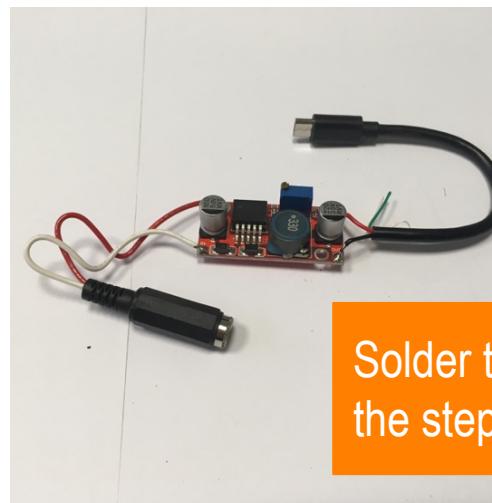

It is advised to connect the DC plugs before soldering

Solder to the IN part of the step-down module

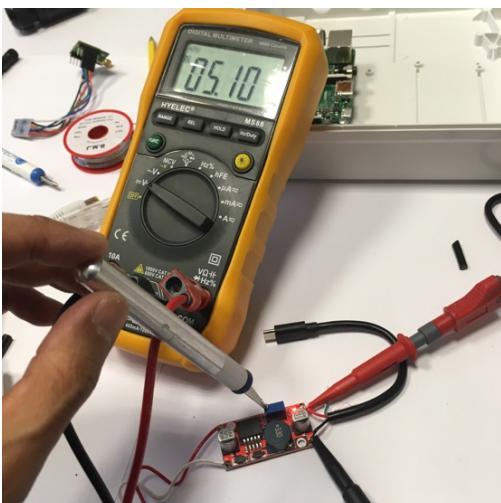

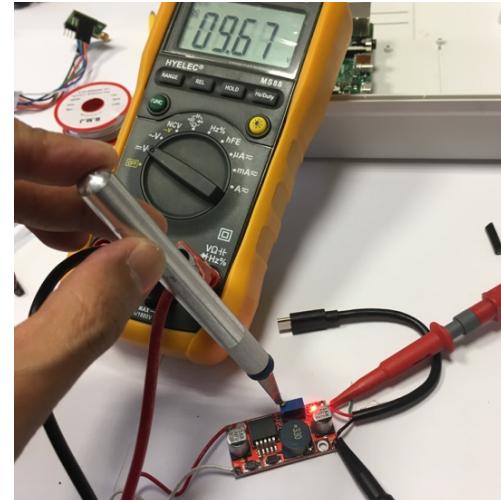

Cut a USB cable, keeping the micro-USB side

Solder to the OUT part of the step-down module

# SETTING THE STEP-DOWN MODULE

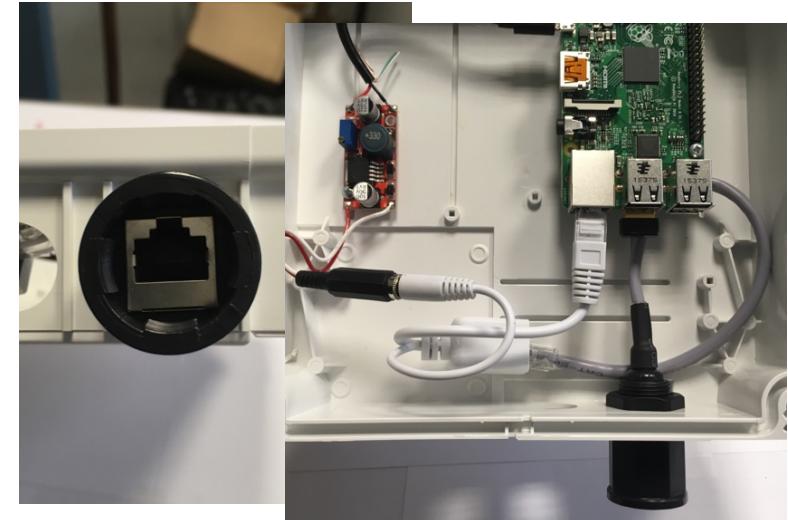

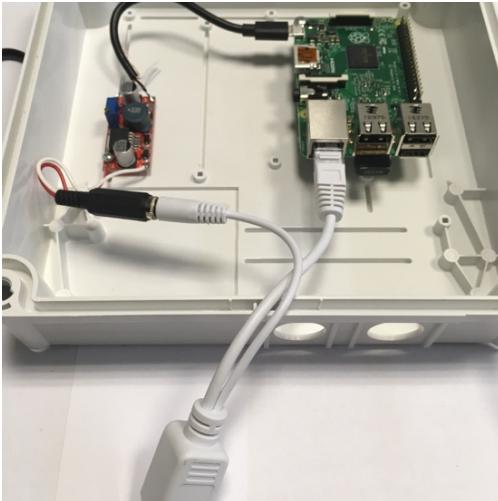

Use for instance a 9v, 12v or 18V AC-DC adaptor, connect to the IN plug, then check the output voltage with a voltmeter and turn the regulation screw until output is about 5.1v.

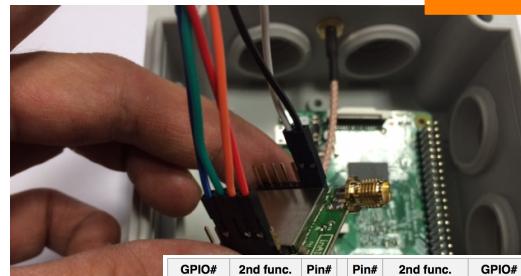

Then fix the module to the case

# INSTALLING THE POE INJECTOR AND WATER-RESISTANT ETHERNET PLUG

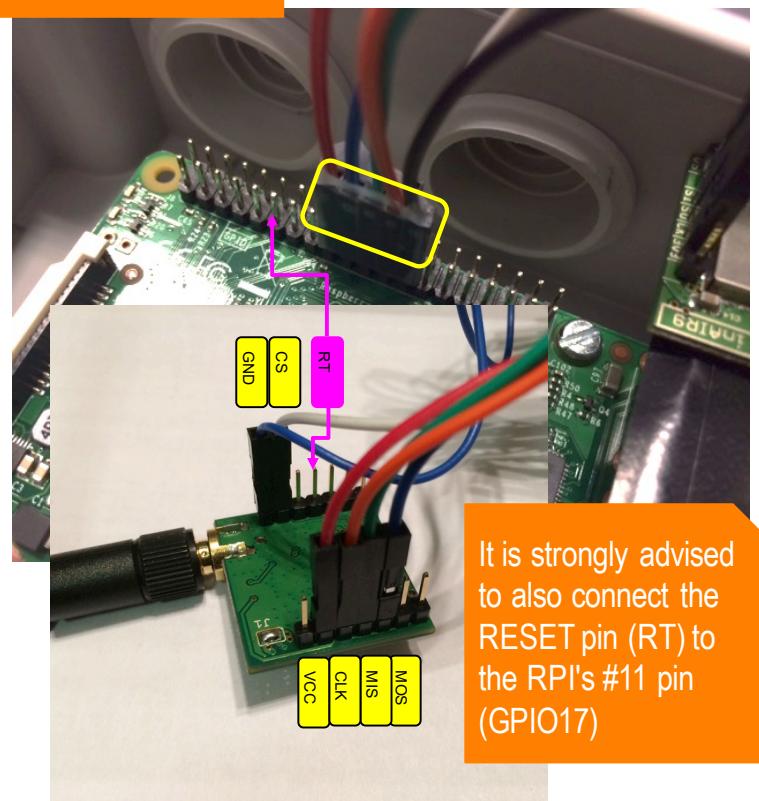

# CONNECT THE RADIO MODULE

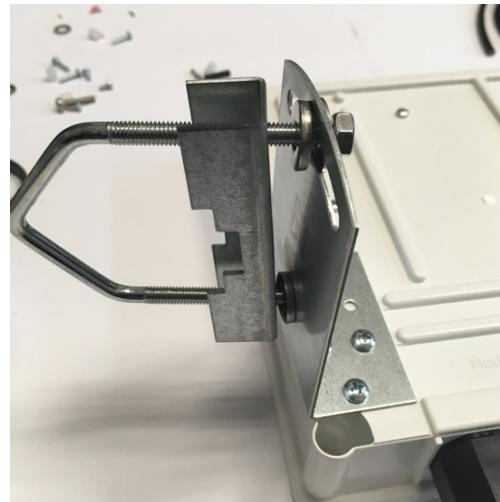

GPIO#	2nd func.	Pin#	Pin#	2nd func.	GPIO#
	+3.3 V	1	2	+5 V

Like previously shown

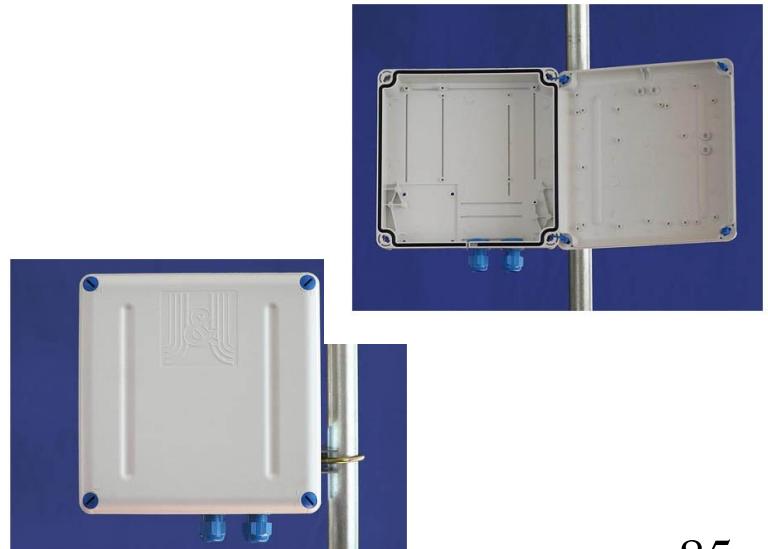

# INSTALL FIXING PARTS OF THE CASE

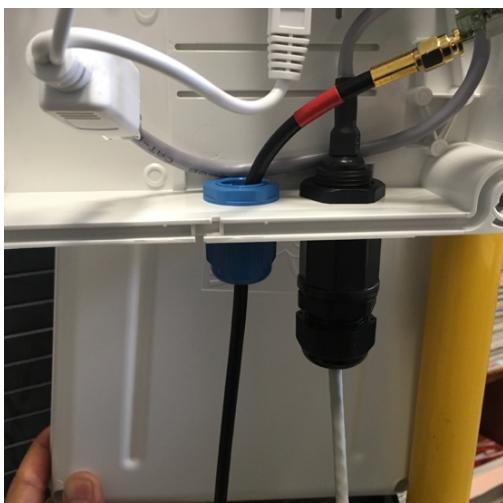

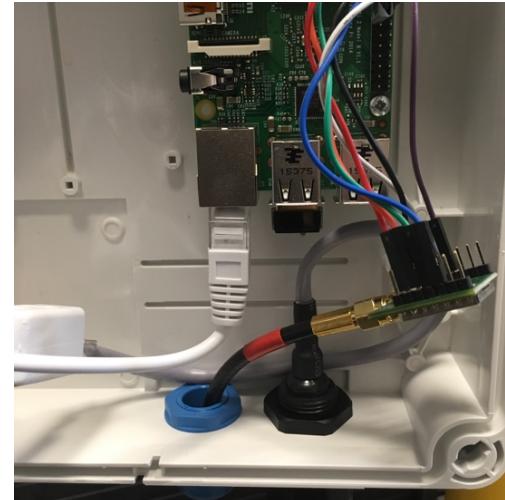

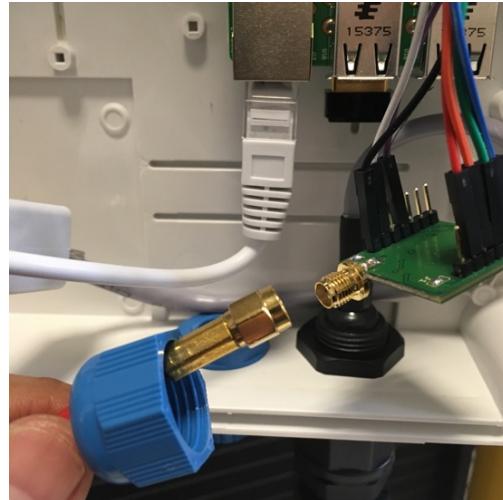

These parts of course depends on the case that you have.

Here we use the GentleBOX JE-200 case from MHzShop.

# FIXING THE ANTENNA CABLE

Look at the Antenna tutorial to see how an antenna cable can be made to adapt both the cable length and the antenna connectors

# CONNECTING AND POWERING YOUR GATEWAY
